

SCCM Clean Install Guide | Server 2022, ConfigMgr 2103, SQL 2019 Replacing Existing ConfigMgr

[Leave a Comment](#) / [By Cory Fiala](#) / [November 8, 2021](#) / [9 minutes of reading](#)

Today is an exciting day for me as I'm embarking on the task of rebuilding our 5-year-old sysctr server that was built on 2012R2. As I begin this process, I wanted to document the steps I'm taking to bring up a new instance alongside the existing server.

Rebuilding a server can be a daunting task, but with proper planning and execution, it can be done smoothly. In this blog post, I'll take you through the steps I'm taking to rebuild our sysctr server.

The only thing missing from this which I already have configured from our previous SCCM [setup is AD Schema. Great guide here.](#)

Server Setup

My specs are overkill but I have a lot of headspace in my vSphere setup.

- Server 2022
- 32 CPU's
- 48GB Ram
- C: 150GB (OS)
- D: 1TB (DATA)

- E: 150GB (SQL)
- 10GB NIC

Software Downloads

- Download **SQL Server 2019** – I got it from VLSC but you can [download it from the evaluation center](#).
- Download [SQL Server Management Studio \(SSMS\)](#).
- Download Windows ADK for Windows 11 – [Link](#)
 - [Windows ADK](#)
 - [WinPE add-on for the Windows ADK](#)
- Download [Microsoft Endpoint Configuration Manager](#) – Current Branch – 2103 (Use VLSC if you have it)
- Download [Microsoft SQL Server 2019 Reporting Services \(SSRS\)](#). –

Active Directory Schema Extension

If your doing a new install you'll need to complete this step. Since I already have a server, I'll be skipping it.

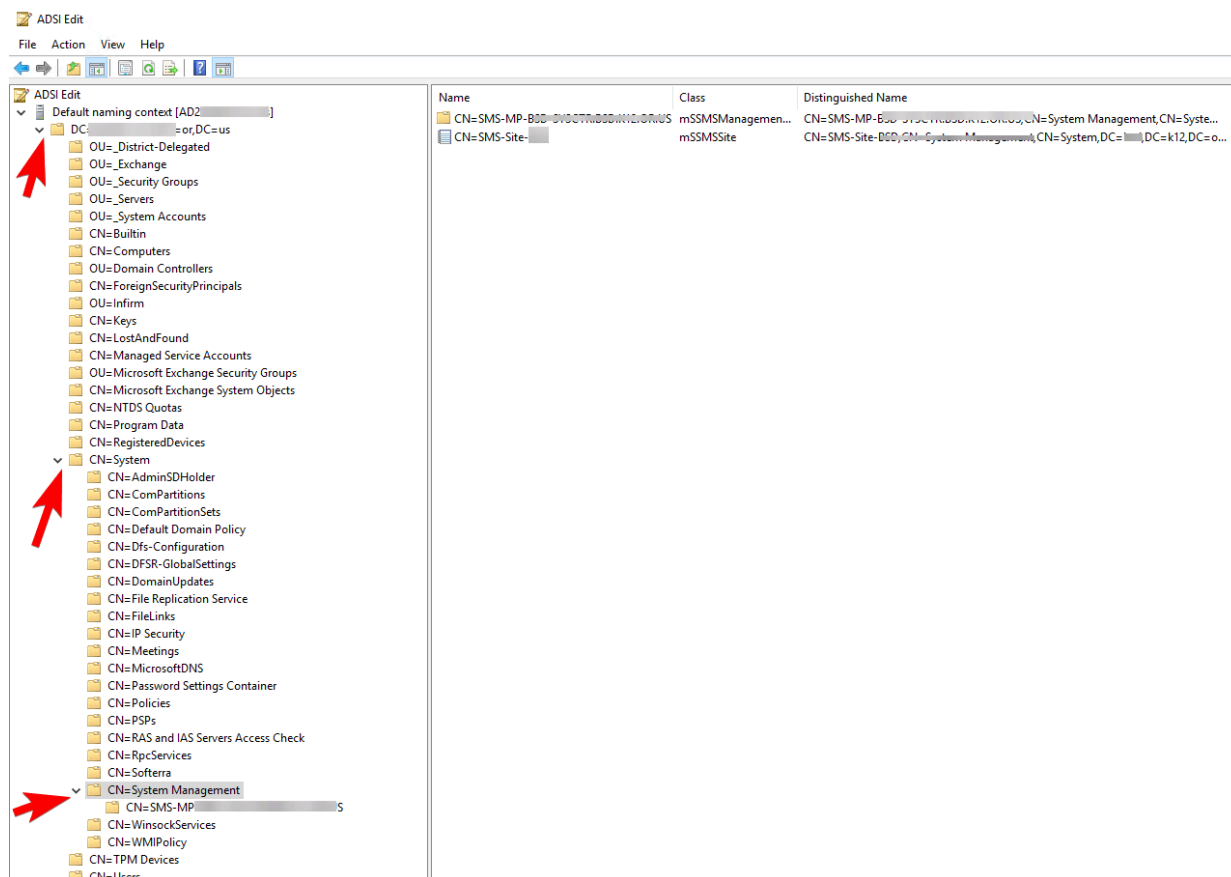

ADSI Edit | System Management Container

Assuming that you have a previous version installed, you should already have the necessary components in place. However, if they are missing, you'll need to create them. In my case, I'm adding the new server alongside the old one, and will need to remove the old server once the migration process is complete. To accomplish this, I will need to modify the existing settings accordingly.

It's OK to have more than 1 server in System Management with Full Access

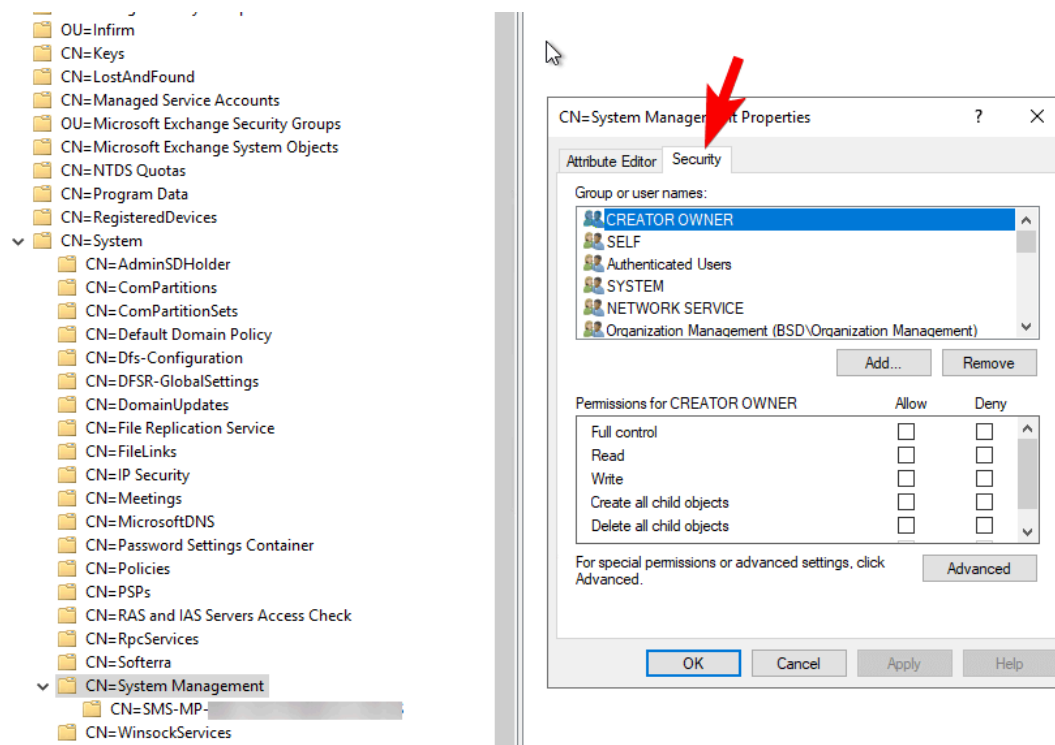

Open up **ADSIEdit**, on your domain controller.

Expand the structure tree **Domain > CN=System Management**. You should see your existing server.

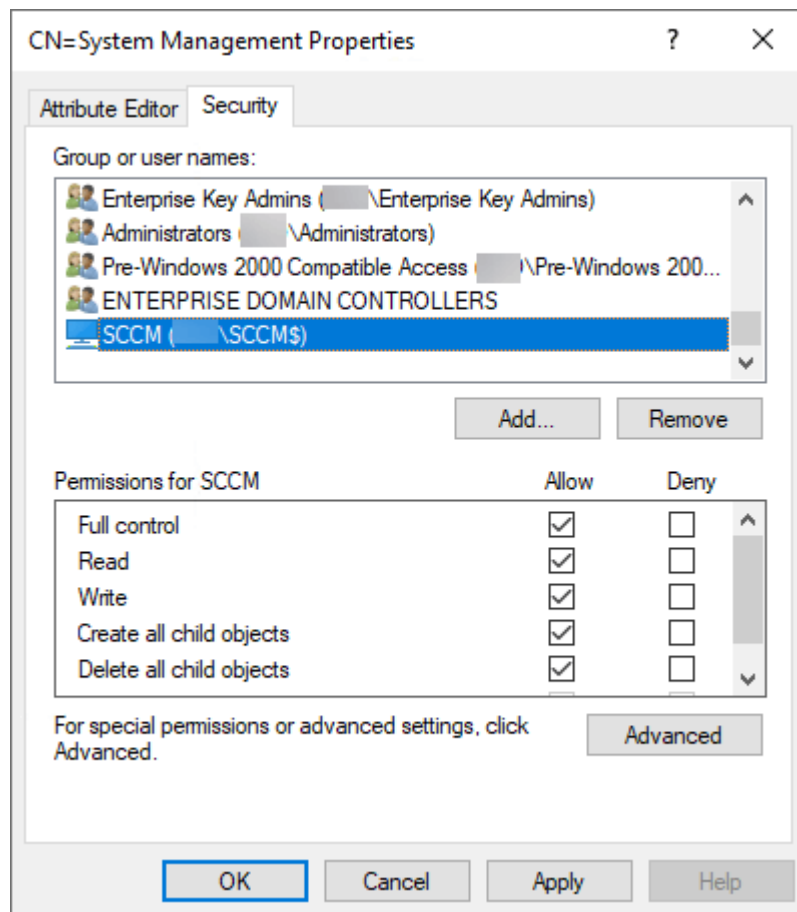

ADSI Edit System Management

Right Click > Select **Properties** then select the **Security** tab.

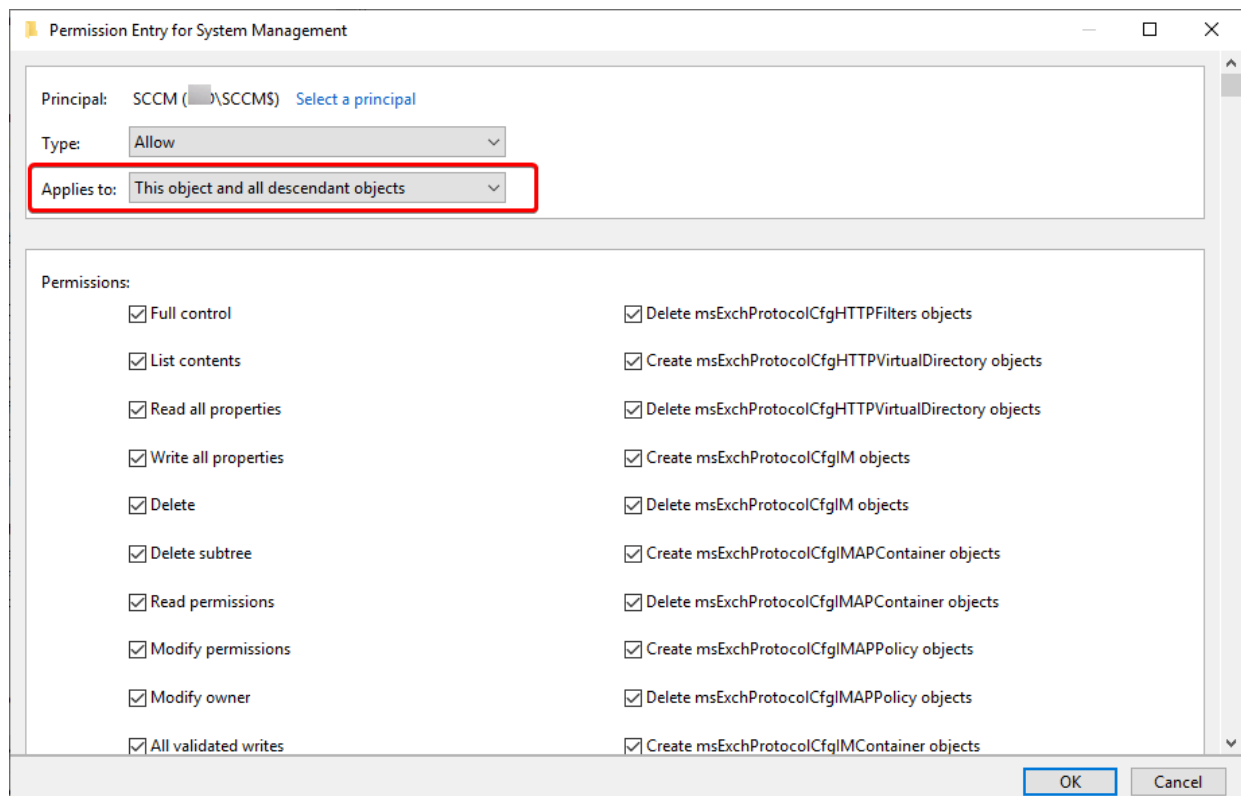

Security Settings for System Management

We need to **Add** our new server and **Grant Full Control permissions**. You need to change the object types to include **computers**. Hold off on clicking apply and and OK.

Added Computer with Full Control

Click **Advanced**, double click the new server (SCCM\$ for me) and change **Applies to: This object and all descendant objects**.

Advanced Permissions for the new server

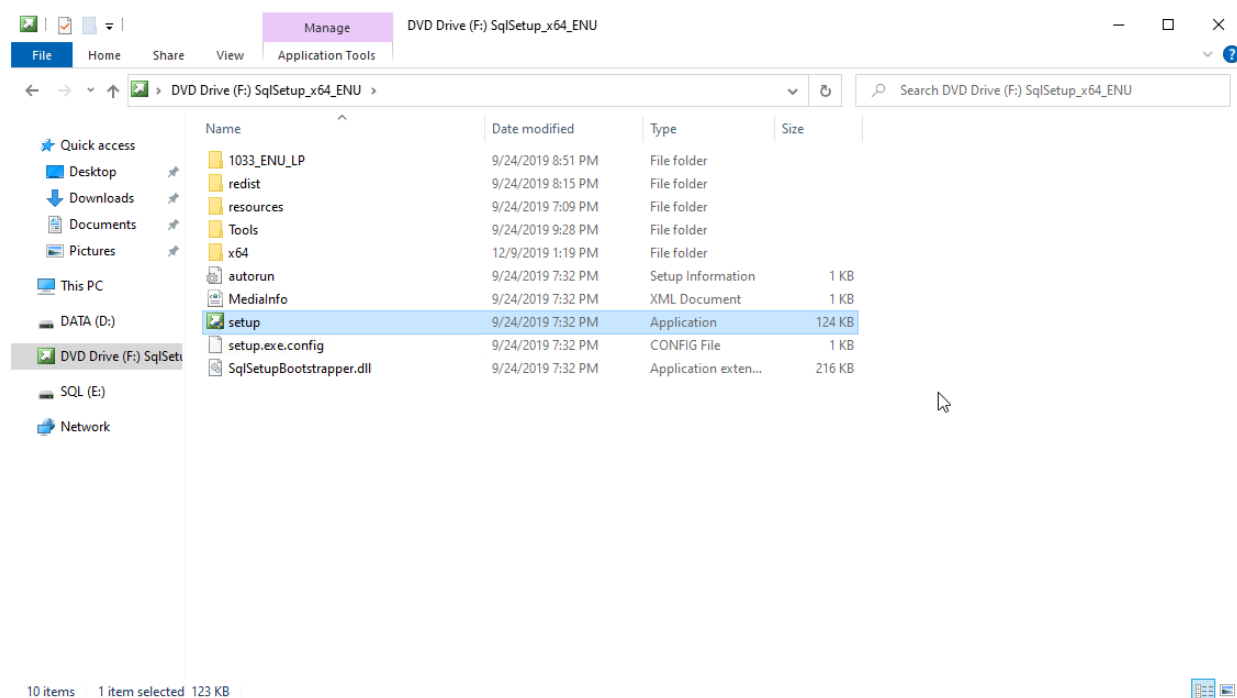

Done!

Install SQL Server 2019

Ideally, I would install this on a separate box rather than on my SCCM server. However, in our current setup, I don't see any compelling reasons to do so. Our vSphere environment is equipped with all-flash storage, which means we should have sufficient resources to accommodate both applications without sacrificing performance. Therefore, I have decided to install it on my SCCM server.

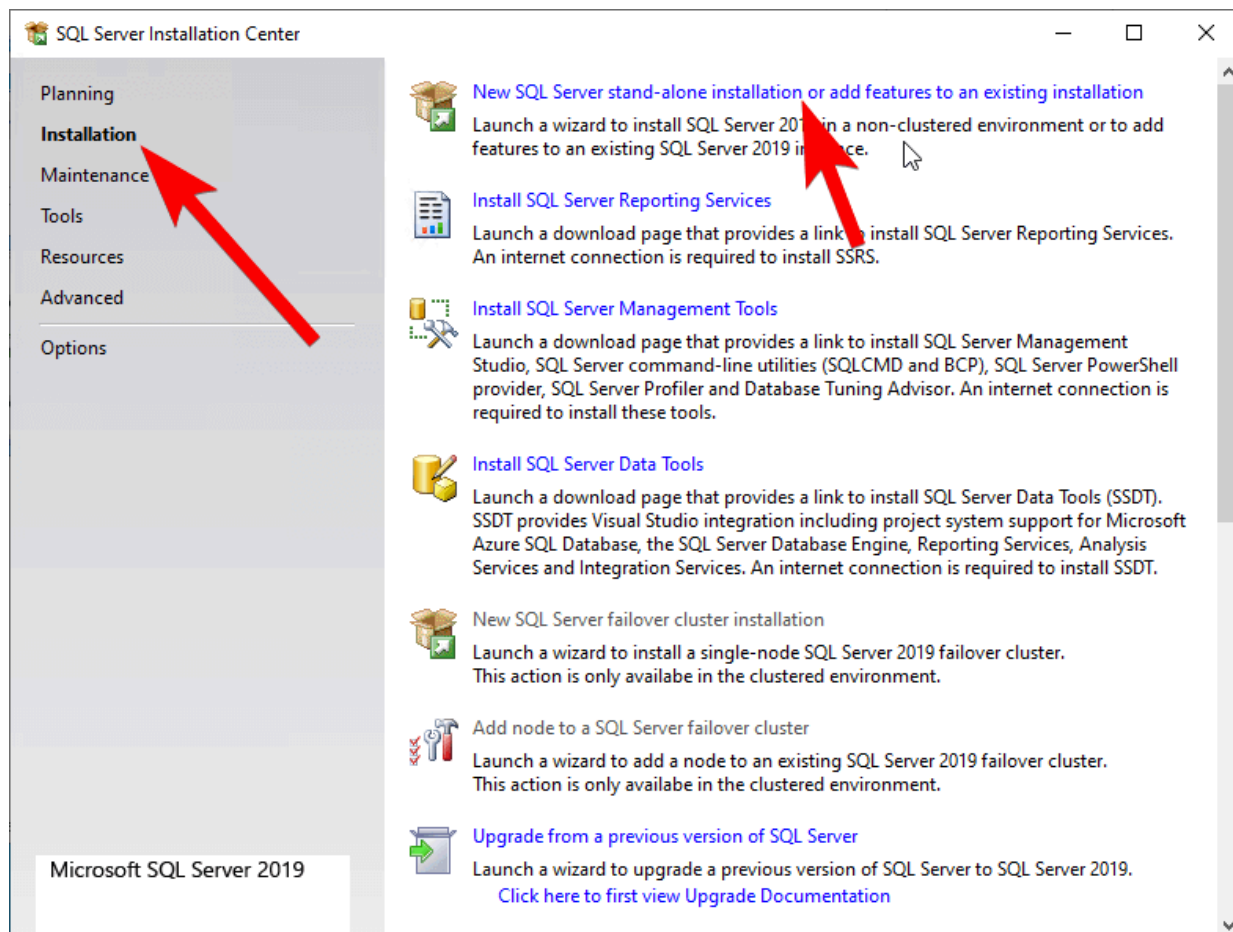

Note: Great time to take a snapshot before we start installing incase you need to role back.

Open up the ISO we downloaded
(SW_DVD9_NTRL_SQL_Svr_Standard_Edtn_2019Dec2019_64Bit_English_OEM_VL_X22-22109)
and run the setup.exe file.

Inside the SQL ISO

Select **Installation** then **New SQL Server stand-alone installation or add features to an existing installation**.

SQL Server Installation Center

Next page is the **Product Key** page. Put in your license key in if you have one otherwise select evaluation. **Next.**

SQL Server 2019 Setup

Product Key

Specify the edition of SQL Server 2019 to install.

Product Key

- License Terms
- Global Rules
- Microsoft Update
- Product Updates
- Install Setup Files
- Install Rules
- Feature Selection
- Feature Rules
- Feature Configuration Rules
- Ready to Install
- Installation Progress
- Complete

Validate this instance of SQL Server 2019 by entering the 25-character key from the Microsoft certificate of authenticity or product packaging. You can also specify a free edition of SQL Server: Developer, Evaluation, or Express. Evaluation has the largest set of SQL Server features, as documented in SQL Server Books Online, and is activated with a 180-day expiration. Developer edition does not have an expiration, has the same set of features found in Evaluation, but is licensed for non-production database application development only. To upgrade from one installed edition to another, run the Edition Upgrade Wizard.

☐ Specify a free edition:

Evaluation

☒ Enter the product key:

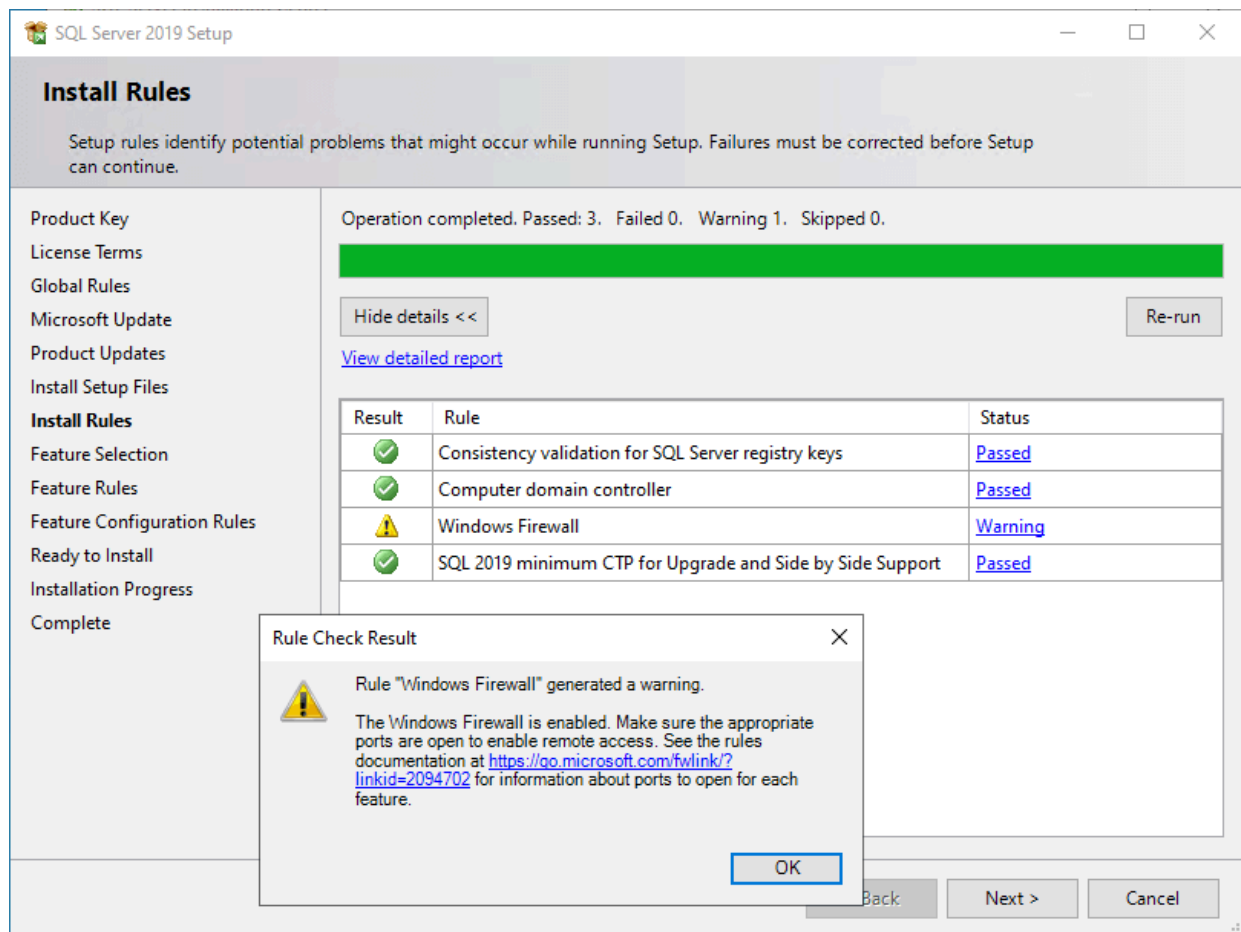

F 4

< Back Next > Cancel

Product Key Tab

Go ahead and **Agree** to the license, and **Use Microsoft Update to check for updates (recommended)**. Keep going until you get to the **Install Rules** page.

On the **Install Rules** page you'll receive a warning about the Windows Firewall. You can [see a list of the ports here](#). We'll configure these in the next step.

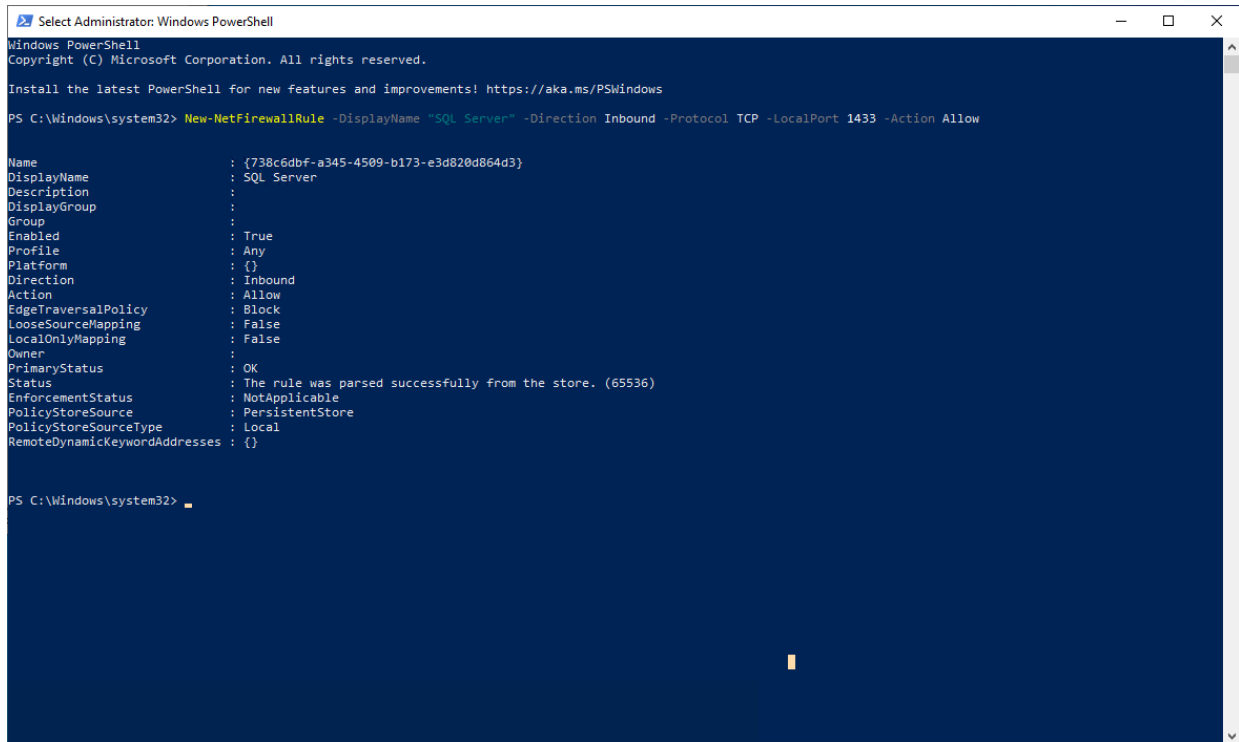

Warning on Install Rules – Windows Firewall

The necessary TCP / UDP ports required to pen are ports **1433,1434,4022,135**. Lets configure these via PowerShell. Open Powershell (don't forget to run as admin) and paste the following:

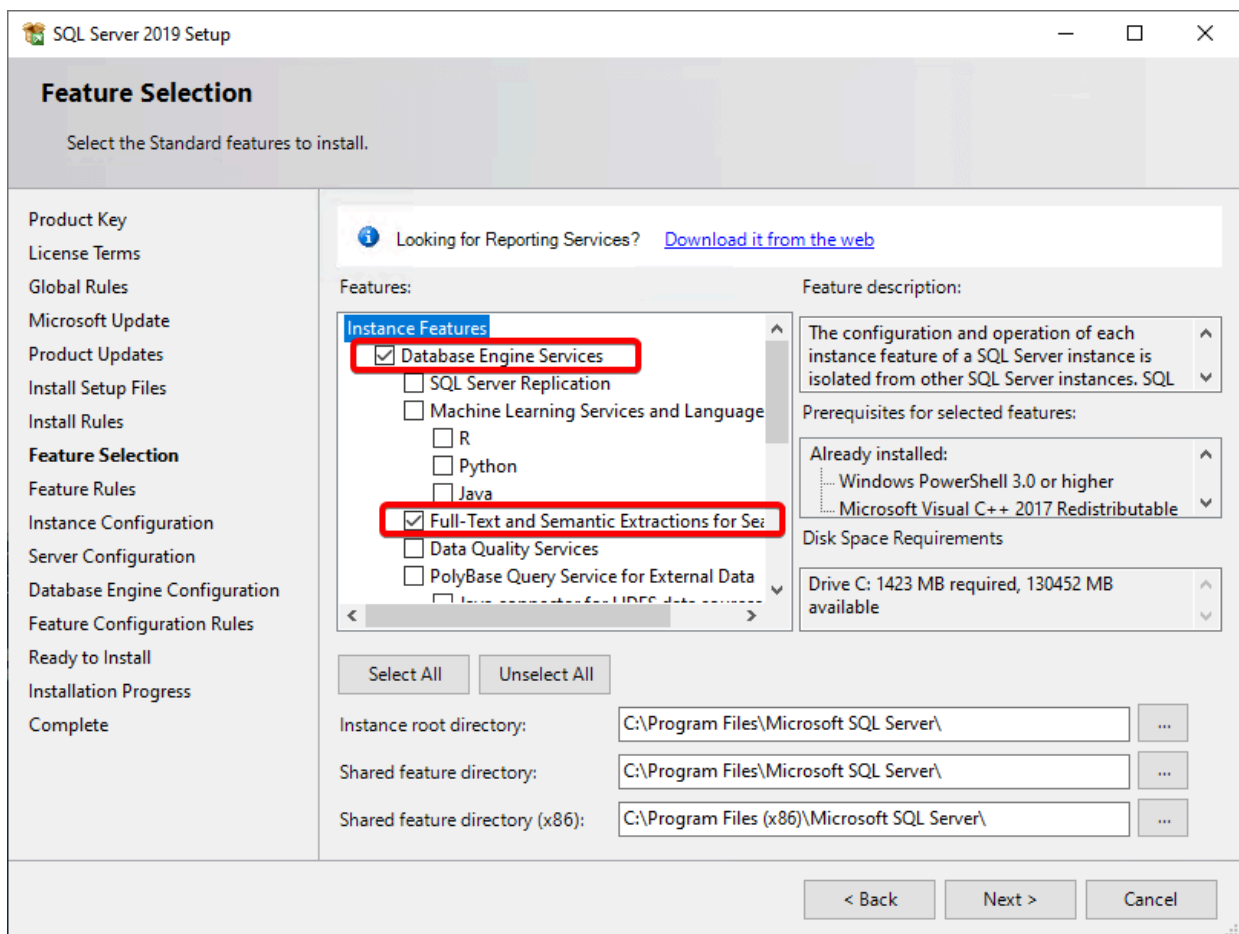

EDIT: Open up **PowerShell ISE** and paste the rules there. For some reason pasting them into PowerShell removes the quotes breaking the command.

```
New-NetFirewallRule -DisplayName "SQL Server" -Direction Inbound
-Protocol TCP -LocalPort 1433 -Action allow
New-NetFirewallRule -DisplayName "SQL Admin Connection" -
Direction Inbound -Protocol TCP -LocalPort 1434 -Action allow
New-NetFirewallRule -DisplayName "SQL Database Management" -
Direction Inbound -Protocol UDP -LocalPort 1434 -Action allow
New-NetFirewallRule -DisplayName "SQL Service Broker" -Direction
Inbound -Protocol TCP -LocalPort 4022 -Action allow
New-NetFirewallRule -DisplayName "SQL Debugger/RPC" -Direction
Inbound -Protocol TCP -LocalPort 135 -Action allow
```

Adding Firewall Rule

Next tab, **Feature Selection**, select **Database Engine Services** and **Full-Text and Semantic Extractions**

SQL Feature Selection

Now click next to **Instance Configuration**. You can leave this default but I'll be changing it to a more unique identifier. Named Instance will be set as **MYSQLSCCM**.

Instance Configuration

Specify the name and instance ID for the instance of SQL Server. Instance ID becomes part of the installation path.

The credentials you provided for the 'SQLAgent\$MYSQSCCM' service is invalid.
The SQL Server service account login or password is not valid. Use SQL Server Configuration Ma...

< Back Next > Cancel

Error with invalid credentials. Oops forgot to uncheck user must change password on next login.

Next, for **Authentication Mode**, keep **Windows authentication mode** selected, and at the bottom click **Add Current User**. I'm also adding Domain Admins group.

The screenshot shows the 'Database Engine Configuration' window in the SQL Server 2019 Setup. The 'Server Configuration' tab is selected. The 'Authentication Mode' is set to 'Windows authentication mode'. The 'Specify the password for the SQL Server system administrator (sa) account' section has empty fields for 'Enter password' and 'Confirm password'. The 'Specify SQL Server administrators' list contains one entry: 'I \adop2 (AD Operator 2)'. Below the list are buttons for 'Add Current User', 'Add...', and 'Remove'. A note on the right states: 'SQL Server administrators have unrestricted access to the Database Engine.' The left sidebar shows the installation progress, with 'Database Engine Configuration' highlighted. The bottom has '< Back', 'Next >', and 'Cancel' buttons.

Database Engine Configuration – Windows Authentication

Data Directories tab we'll change the **Data root directory** to the **E Drive** I created for SQL.

The screenshot shows the 'Database Engine Configuration' window in the SQL Server 2019 Setup, with the 'Data Directories' tab selected. The 'Data root directory' is set to 'E:\Program Files\Microsoft SQL Server\'. The 'System database directory' is set to 'E:\Program Files\Microsoft SQL Server\MSSQL15.MYSQLSCCM\MSSQL\Data'. The 'User database directory', 'User database log directory', and 'Backup directory' are all set to 'E:\Program Files\Microsoft SQL Server\MSSQL15.MYSQLSCCM\'. The left sidebar shows the installation progress, with 'Database Engine Configuration' highlighted. The bottom has '< Back', 'Next >', and 'Cancel' buttons.

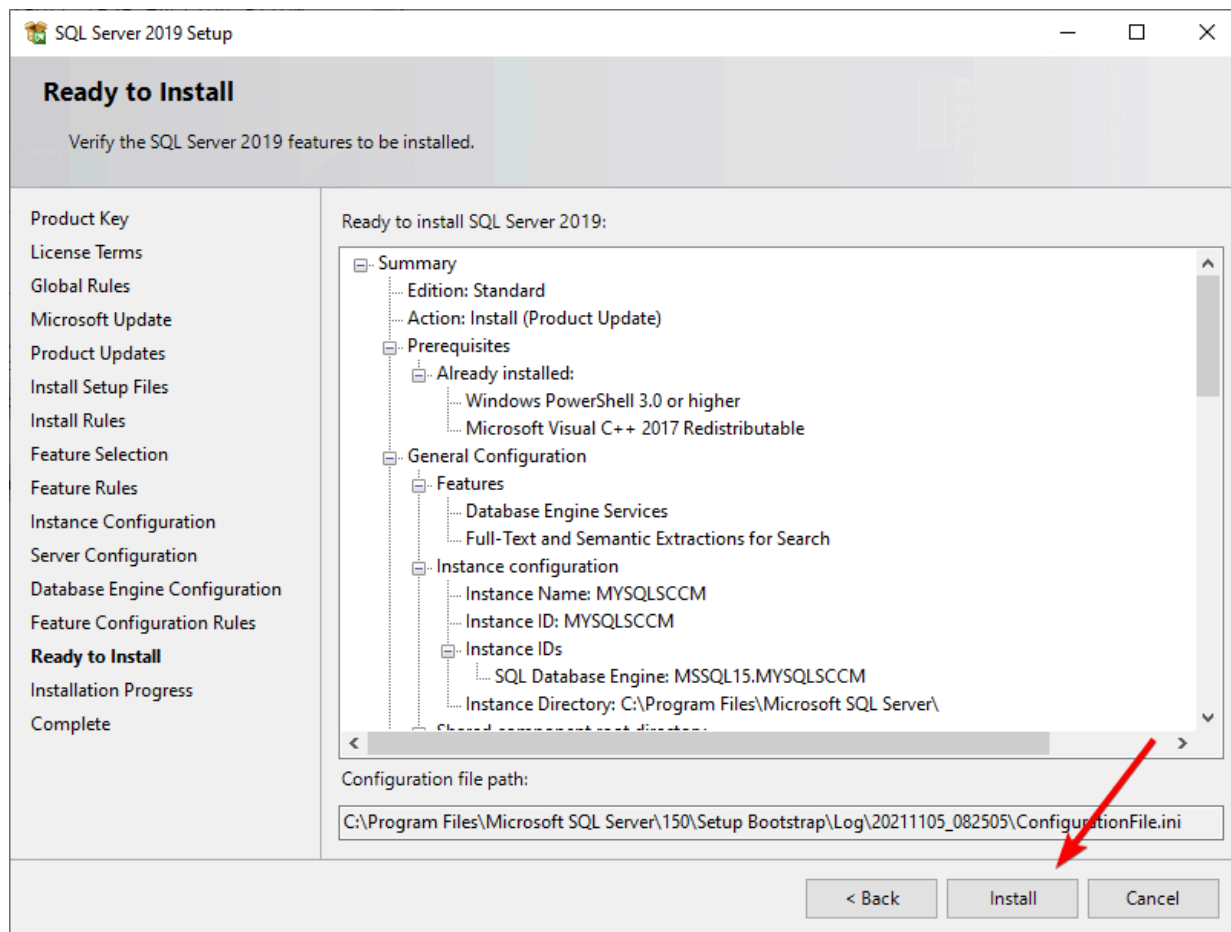

Data Directory

TempDB tab, double check to make sure it's also pointing to **E**. It should of changed automatically.

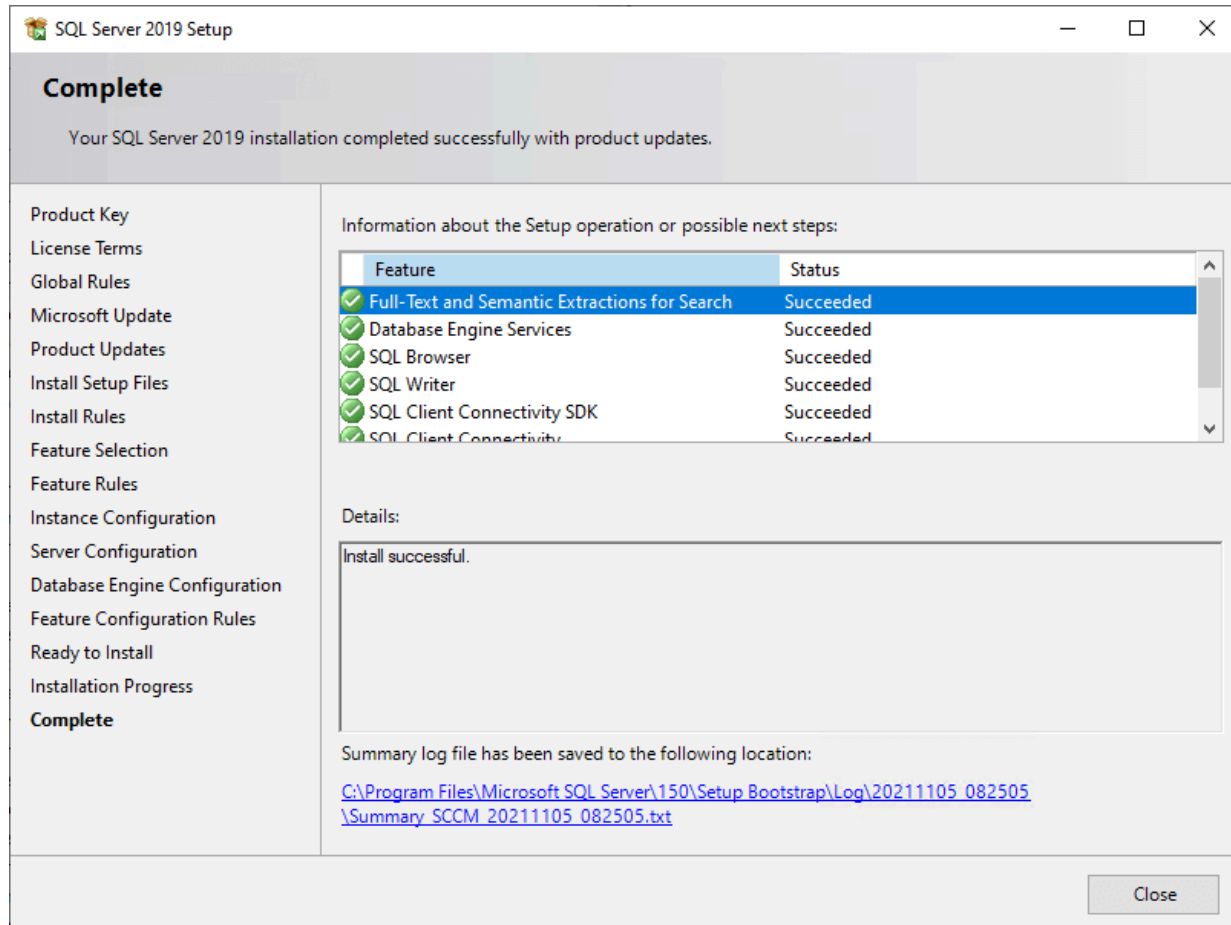

The screenshot shows the 'SQL Server 2019 Setup' window, specifically the 'Database Engine Configuration' tab. The 'TempDB' sub-tab is selected. The window is divided into a left sidebar with installation steps and a main configuration area. In the main area, the 'TempDB data files' section shows 'tempdb.mdf, tempdb_mssql_#.ndf' with 'Number of files' set to 8, 'Initial size (MB)' at 8, 'Total initial size (MB)' at 64, 'Autogrowth (MB)' at 64, and 'Total autogrowth (MB)' at 512. The 'Data directories' field is highlighted with a red box and contains the path 'E:\Program Files\Microsoft SQL Server\MSSQL15.MYSQLSCCM\'. To its right are 'Add...' and 'Remove' buttons. Below this, the 'TempDB log file' is 'templog.ldf' with 'Initial size (MB)' at 8 and 'Autogrowth (MB)' at 64. A note states 'Setup could take longer with large initial size.' The 'Log directory' field at the bottom is also highlighted with a red box and contains the same path 'E:\Program Files\Microsoft SQL Server\MSSQL15.MYSQLSCCM\'. At the bottom of the window are '< Back', 'Next >', and 'Cancel' buttons.

Data Directory and Log Directory

Looks like we're ready to **install**! Go ahead and click **install**. It will take a few minutes to complete.

Ready to Install

Install successful

Looks like everything install correctly!

Tip: Taking another snapshot.

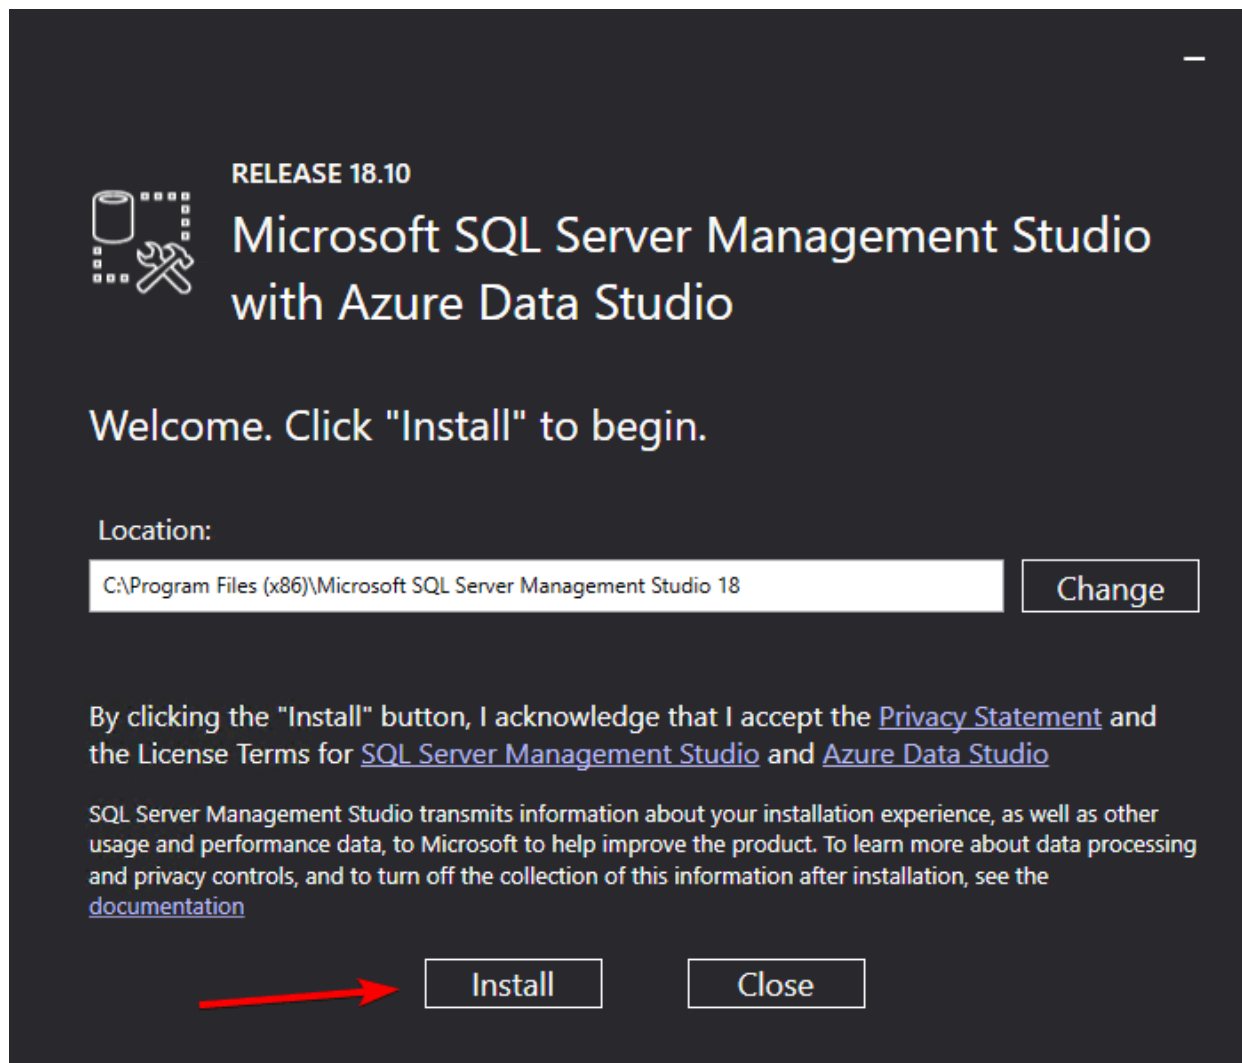

Task Name	Target	Status	Details	Init
Create virtual machine snapshot	SCCM-NEW	86 %		VS

Taking vSphere snapshot

Install SQL Server Management Studio (SSMS)

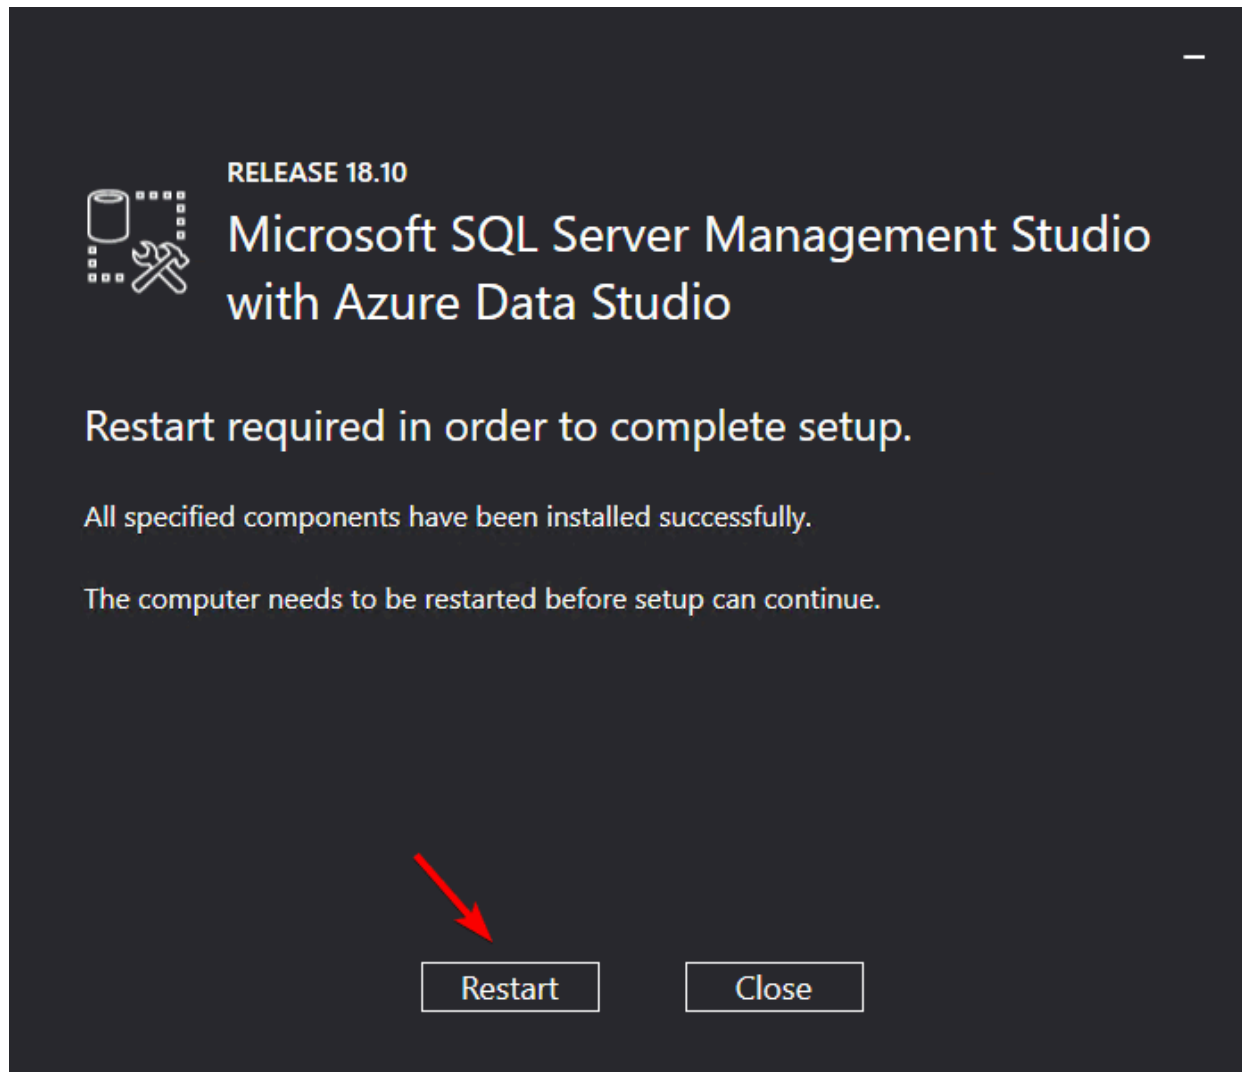

Now we have SQL installed we need a way to view our databases. This is what SSMS does.

Run the file (SSMS-Setup-ENU) we downloaded earlier. Should only take a few minutes.

Install

Once complete, **reboot**.

Restart after install

Install Windows ADK 11

Windows Assessment and Deployment Kit (aka ADK) consists of the tools designed to help deploy operating systems to the target.

Lets run `adksetup.exe`

Windows Assessment and Deployment Kit

Specify Location

☒ Install the Windows Assessment and Deployment Kit to this computer

Install Path:

C:\Program Files (x86)\Windows Kits\10\ Browse...

☐ Download the Windows Assessment and Deployment Kit for installation on a separate computer

Download Path:

C:\Users\adop2\Downloads\Windows Kits\10\ADK Browse...

Estimated disk space required: 1.5 GB
Disk space available: 121.9 GB

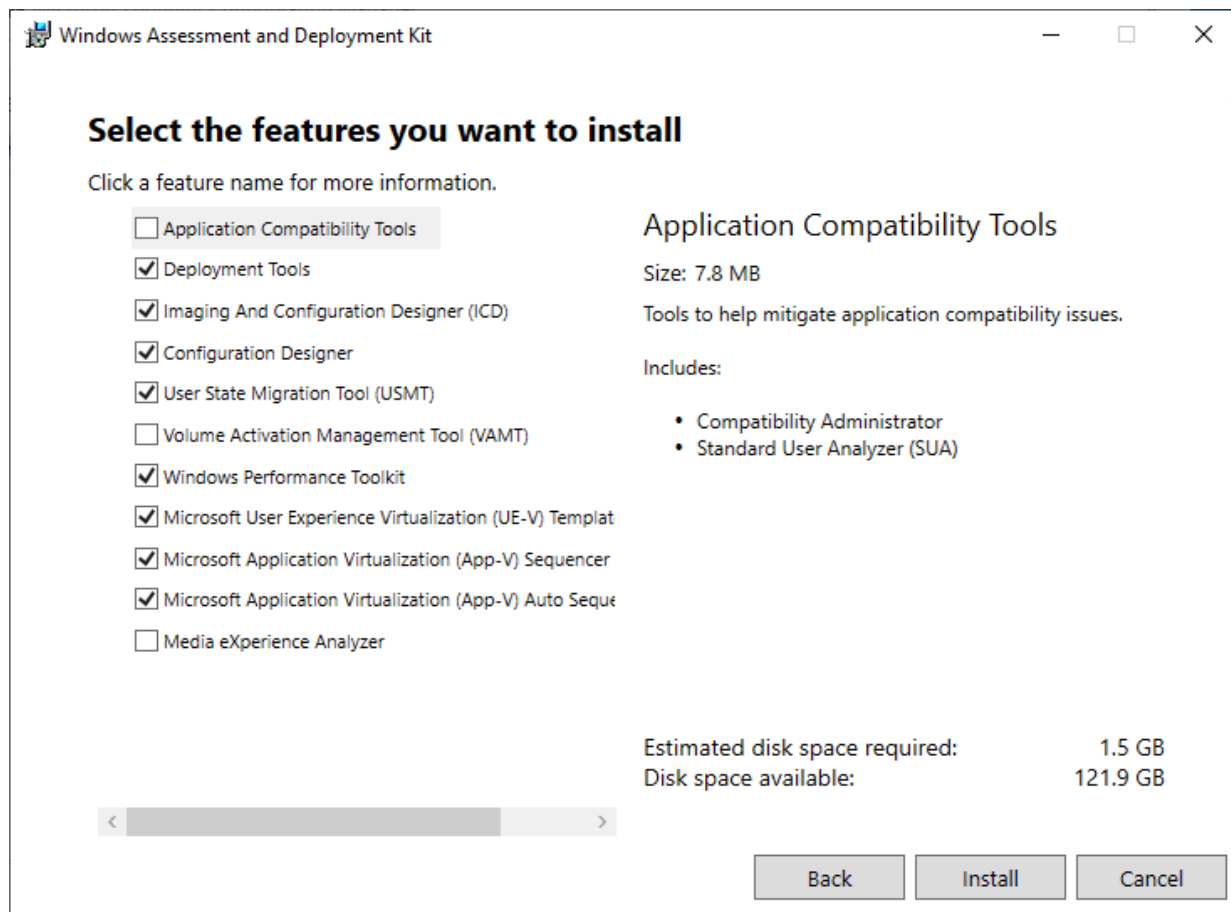

Next Cancel

Specify Location

Click **Next** until you get to the **Select the features you want to install** screen.

Now make sure the following are selected.

- Deployment Tools
- Imaging And Configuration Designer (ICD)
- Configuration Designer
- User State Migration Tool (USMT)
- Windows Performance Toolkit
- Microsoft User Experience Virtualization (UE-V) Template
- Microsoft Application Virtualization (App-V) Sequencer
- Microsoft Application Virtualization (App-V) Auto Sequencer

Select the necessary features to install

Let the install **finish** then move onto WinPE.

Install Windows Assessment and Deployment Kit Windows Preinstallation Environment Add-ons

Here is another critical piece to SCCM. ADKWinPE consists of the boot images required for operating system deployment (OSD). Let's run adkwinpesetup.exe we downloaded earlier.

Windows Assessment and Deployment Kit Windows Preinstallation Environment Add-ons

Specify Location

☒ Install the Windows Assessment and Deployment Kit Windows Preinstallation Environment Add-ons to this computer

Install Path:

C:\Program Files (x86)\Windows Kits\10\ Browse...

* Windows Kit common installation path used

☐ Download the Windows Assessment and Deployment Kit Windows Preinstallation Environment Add-ons for installation on a separate computer

Download Path:

C:\Users\adop2\Downloads\Windows Kits\10\ADKWinPEAddons Browse...

Estimated disk space required: 6.0 GB
Disk space available: 120.1 GB

Next Cancel

Specify Location

Click **Next** until you get to the **Select the features you want to install** section. Make sure **Windows Reinstallation Environment (Windows PE)** is checked.

Windows Assessment and Deployment Kit Windows Preinstallation Environment Add-ons

Select the features you want to install

Click a feature name for more information.

☒ Windows Preinstallation Environment (Windows PE)

Windows Preinstallation Environment (Windows PE)

Size: 6.0 GB

Minimal operating system designed to prepare a computer for installation and servicing of Windows.

Includes:

- Windows PE (x86)
- Windows PE (AMD64)
- Windows PE (ARM)
- Windows PE (ARM64)

Estimated disk space required: 6.0 GB
Disk space available: 120.1 GB

Back Install Cancel

Selecting install features

That's it for WinPE.

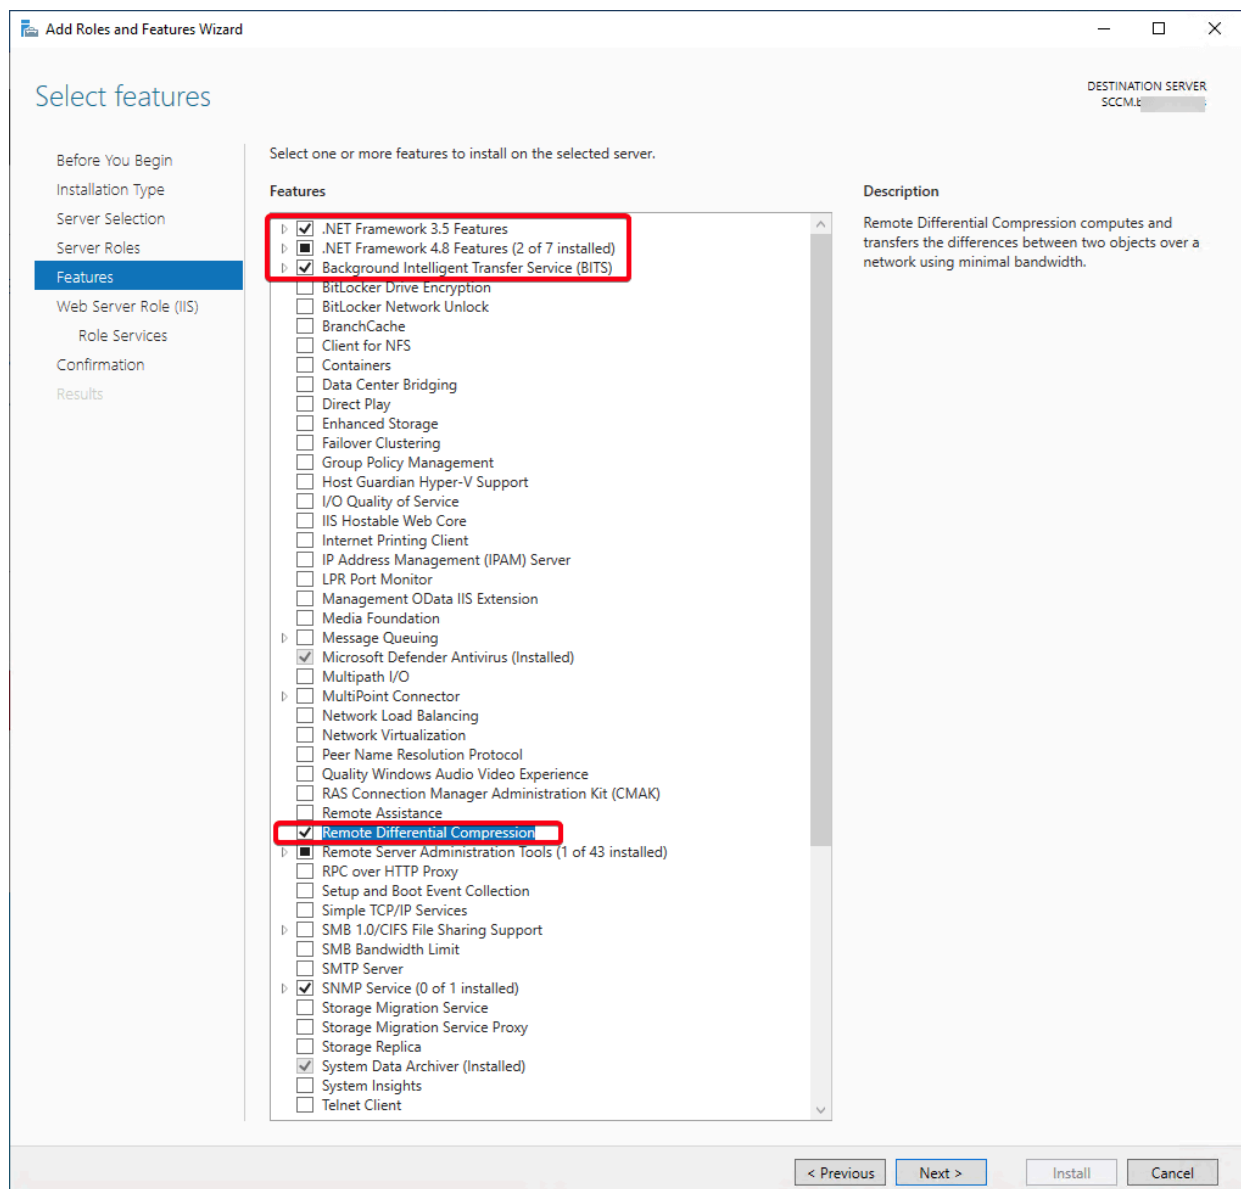

Install SCCM Prerequisites

Now lets install the server roles necessary to install Configuration Manager Server.

On your SCCM server, open up **Server Manager** and click **Add roles and features**.

Select **Features** from the side bar. Enable the following:

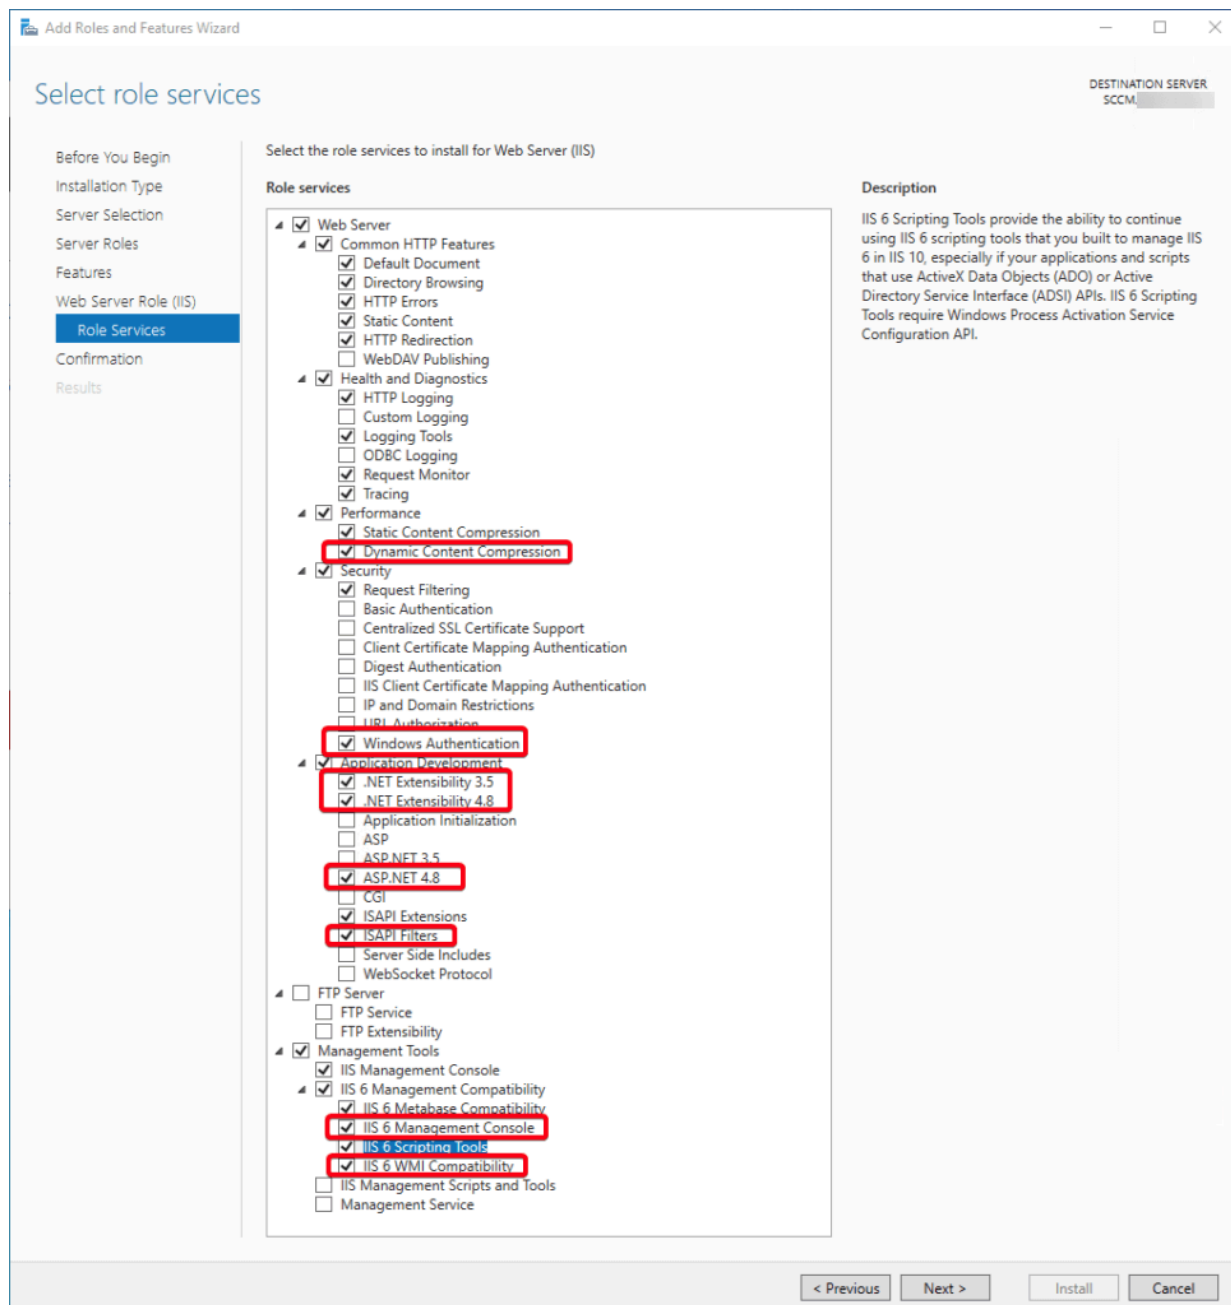

- .NET Framework 3.5 Features
- Background Intelligent Transfer Service (BITS)
- Remote Differential Compression

Install Features

Select **Next** twice until you get to **Role Services** under Web Server Role (IIS). Make sure the following are checked.

- Performance
 - Dynamic Content Compression
- Security
 - Windows Authentication
- Application Development
 - .NET Extensibility 3.5
 - .NET Extensibility 4.8
 - ASP.NET 3.5
 - ASP.NET 4.8
 - ISAPI Filters
- Management Tools
 - IIS 6 Management Compatibility
 - IIS 6 Management Console
 - IIS 6 Metabase Compatibility
 - IIS Management Scripts and Tools

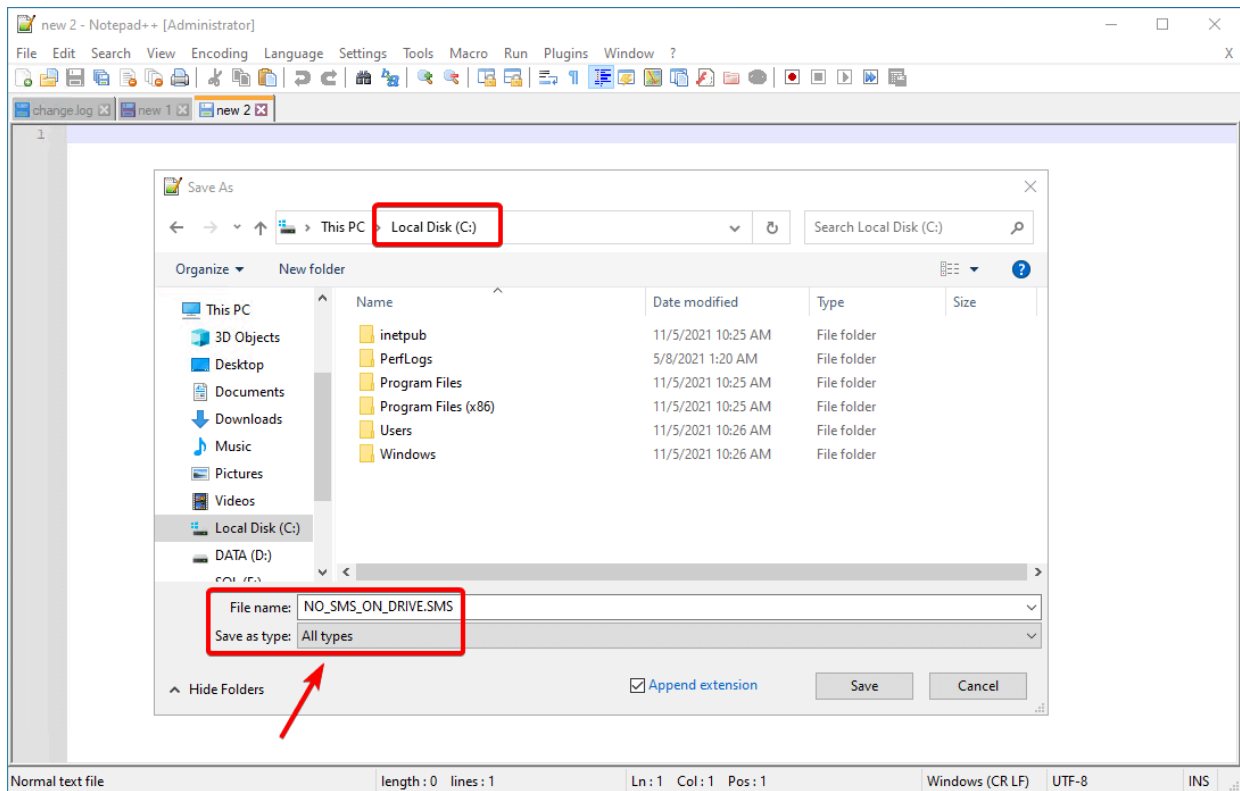

Install the following services

Once complete we'll move onto SCCM.

Block SCCM Access to C:\

ConfigMgr you can create a file called **NO_SMS_ON_DRIVE.SMS**. This prevents site system role component installation on the drive you place it in. You can find more [great info on this here](#).

Open up **Notepad (run as admin)** and click **Save As**. Leave the file black. Save the file name as **NO_SMS_ON_DRIVE.SMS**. To achieve this don't forget to change the **Save as type**: to **All types**.

Repeat this for the SQL drive we created also.

Tip: It's been awhile since we did a snapshot right? Why not do another one? It's free!

Install Configuration Manager

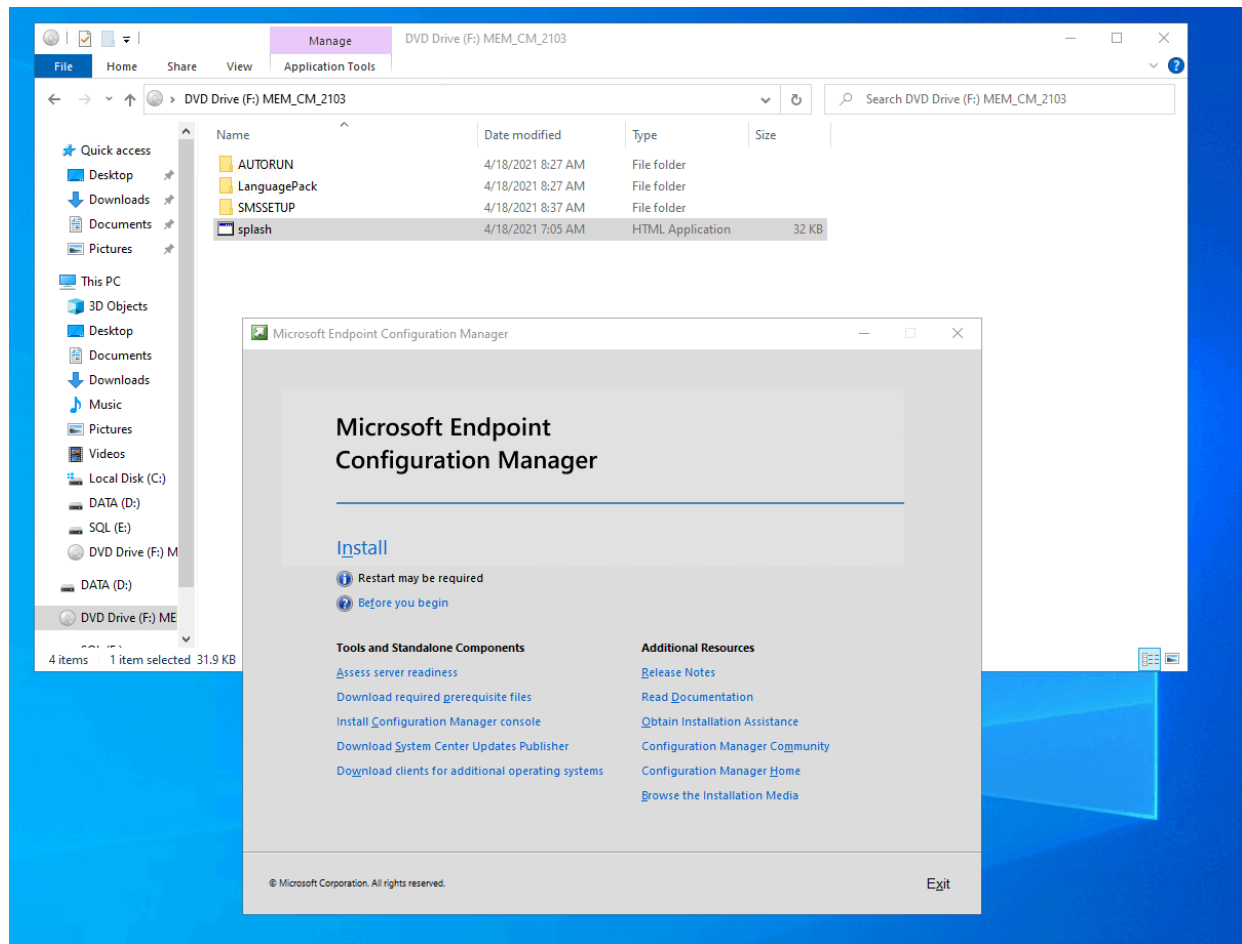

Now to really get our hands dirty! Lets install Microsoft Endpoint Configuration manger! I downloaded this earlier via VLSC (Volume Licensing Service Center) but you can use the link near the top to download an evaluation copy, good for 180 days.

Double click to open and mount

SW_DVD5_MEM_ConfigMgrClt_ML_2103_MultiLang_ConfMgr_MLF_X22-62366.iso.

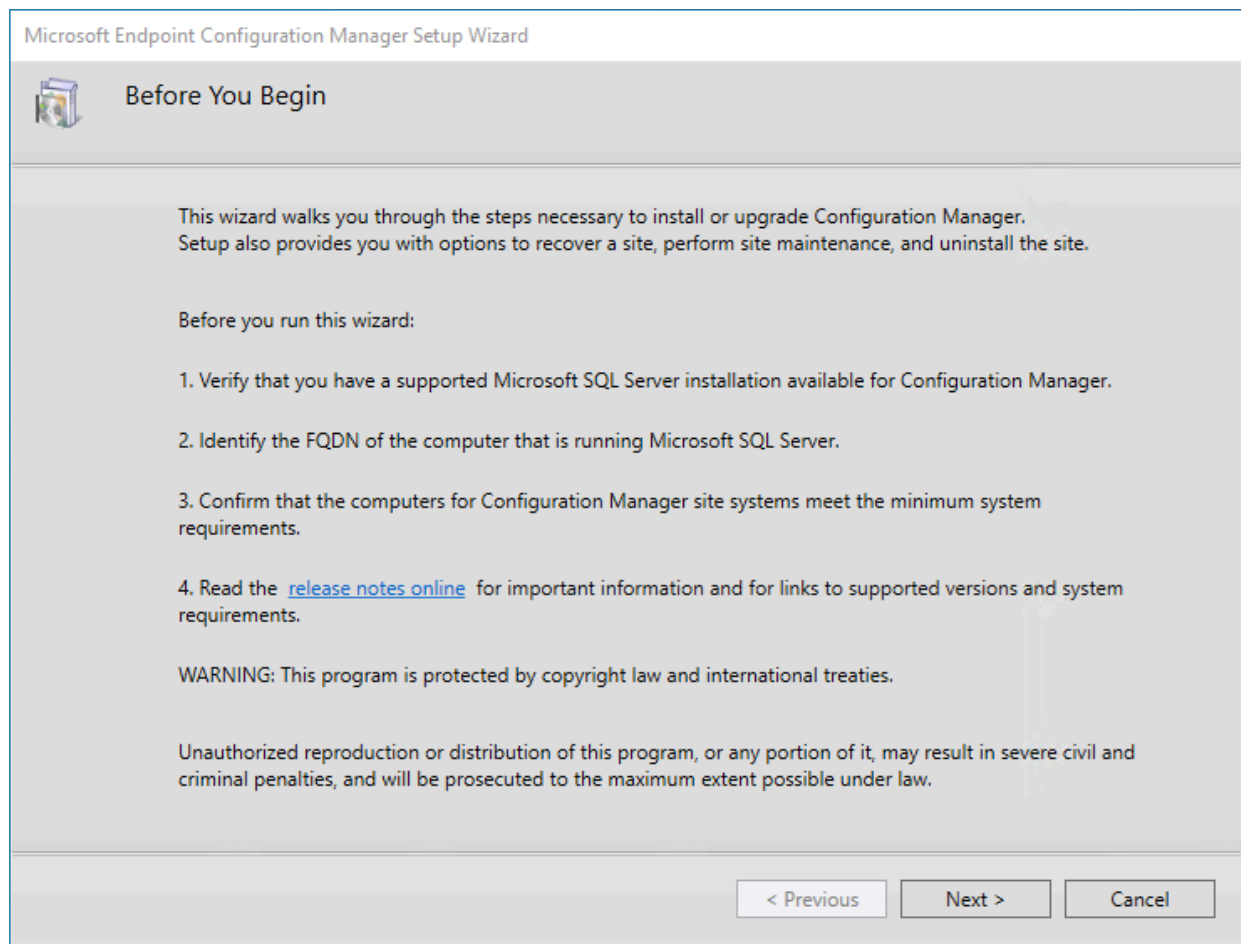

Run splash

The **Microsoft Endpoint Configuration Manger** wizard will start. Click **Install**.

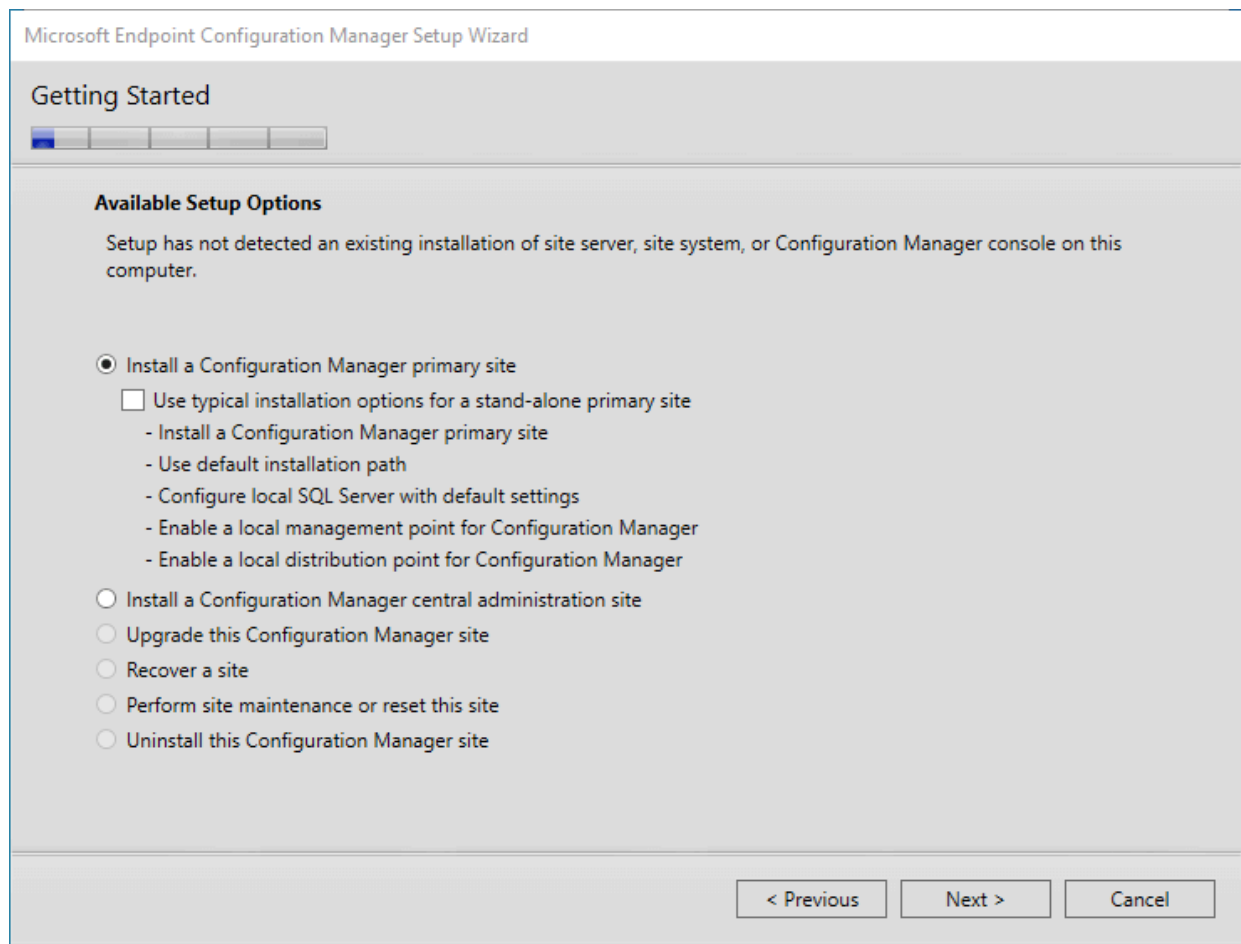

Starting the install running splash.hta

Let's begin

Before you Begin

For my setup since I'm just replacing my existing server and starting over I'll be selecting the first option, **Install a Configuration Manger Primary Site**.

Setup Options

Now the **Product Key** page, I'm going to install my key. You can select the evaluation edition if you don't have one.

Microsoft Endpoint Configuration Manager Setup Wizard

Product Key

☐ Install the evaluation edition of this product
When you install the Current Branch evaluation edition of this product, it is fully functional for 180 days.

☒ Install the licensed edition of this product

I acknowledge that I currently have an active Software Assurance license agreement with Microsoft. I understand that this version of Configuration Manager will have regular updates that can include new feature offerings.

Software Assurance expiration date. This date must be after October 1st, 2016:

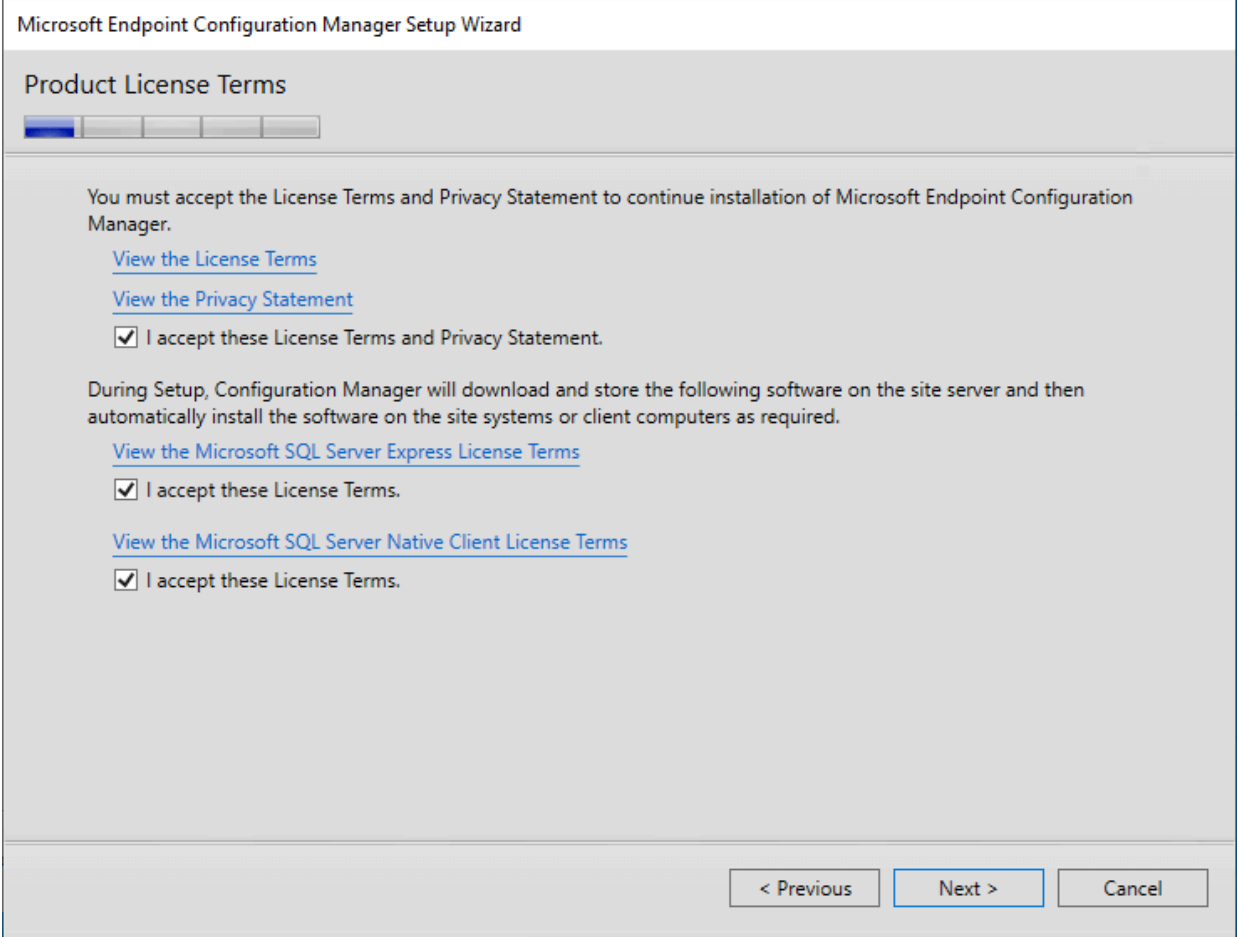

Select a date

< Previous Next > Cancel

License Key

Accept all those lovely license terms. Don't forgot to read them all 😊

The screenshot shows the 'Product License Terms' window of the Microsoft Endpoint Configuration Manager Setup Wizard. The window has a title bar and a progress bar at the top. The main content area contains the following text and links:

You must accept the License Terms and Privacy Statement to continue installation of Microsoft Endpoint Configuration Manager.

[View the License Terms](#)

[View the Privacy Statement](#)

☒ I accept these License Terms and Privacy Statement.

During Setup, Configuration Manager will download and store the following software on the site server and then automatically install the software on the site systems or client computers as required.

[View the Microsoft SQL Server Express License Terms](#)

☒ I accept these License Terms.

[View the Microsoft SQL Server Native Client License Terms](#)

☒ I accept these License Terms.

At the bottom right, there are three buttons: '< Previous', 'Next >', and 'Cancel'.

Product License Terms

Prerequisite Downloads, I'll just set this to my **D: DATA** drive. Make a new folder **D:\prerequisite_downloads**.

Microsoft Endpoint Configuration Manager Setup Wizard

Prerequisite Downloads

Setup requires prerequisite files. Setup can automatically download the files to a location that you specify, or you can use files that have been downloaded previously.

☒ Download required files

Example: \\ServerName\ShareName or C:\Downloads

Path:

☐ Use previously downloaded files

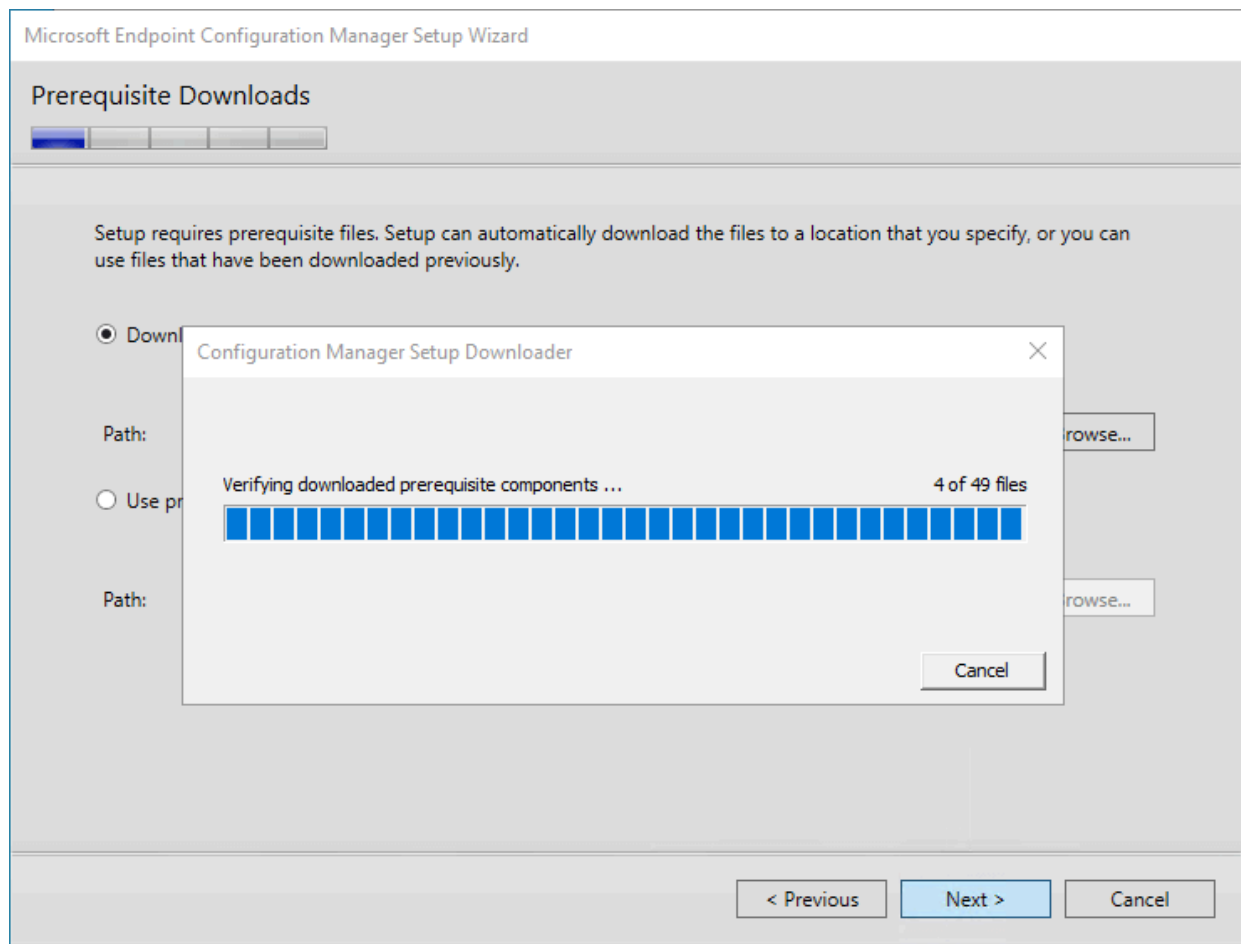

Example: \\ServerName\ShareName or C:\Downloads

Path:

< Previous Next > Cancel

Prerequisite Downloads

Wait for the downloads to finish.

Downloading prerequisite downloads

Server Language Selection, choose which ever you require. Do the same for the **Client Language Selection**.

Microsoft Endpoint Configuration Manager Setup Wizard

Server Language Selection

Select the server languages that Configuration Manager displays in the Configuration Manager console and reports.

Configuration Manager installs support for the languages that you select and uses the display language of the server that runs the Configuration Manager console or reports. English is the default language and it is used when Configuration Manager does not support the display language.

You can modify the server languages if you run Setup again and select the Site Maintenance option.

Currently Supported Languages:

	Name	Availability	State
☐	Chinese (Simplified)	Downloaded	Not Installed
☐	Chinese (Traditional, Taiwan)	Downloaded	Not Installed
☐	Czech	Downloaded	Not Installed
☐	Dutch	Downloaded	Not Installed
☒	English	Not Downloaded	Installed
☐	French	Downloaded	Not Installed
☐	German	Downloaded	Not Installed
☐	Hungarian	Downloaded	Not Installed

< Previous Next > Cancel

Language Selection

Site and Installation Settings we need to specify the following: **Site Code**, **Site Name**, and **Installation folder**. The site code can only be 3 characters/numbers. Since I have an existing system, it must be different than my previous site. This will avoid a lot of headaches.

Change the default **Installation folder** to the **D:** drive.

Microsoft Endpoint Configuration Manager Setup Wizard

Site and Installation Settings

Specify a site code that uniquely identifies this Configuration Manager site in your hierarchy.

Site code:

Specify a site name that helps to identify the site. Example: Contoso Headquarters Site

Site name:

Note: The site code must be unique in the Configuration Manager hierarchy and cannot be changed after you install the site.

Installation folder:

Specify whether to install the Configuration Manager console to manage the Configuration Manager site from this computer. You can remotely manage the site when you do not install the Configuration Manager console.

☒ Install the Configuration Manager console

< Previous Next > Cancel

Site and Installation Settings

Primary Site Installation, I'm treating this a primary stand alone.

The screenshot shows the 'Primary Site Installation' step of the Microsoft Endpoint Configuration Manager Setup Wizard. The window title is 'Microsoft Endpoint Configuration Manager Setup Wizard'. Below the title bar, the section 'Primary Site Installation' is displayed with a progress indicator showing four steps, with the first step being active. The main content area contains the instruction: 'Specify whether to join the primary site to an existing Configuration Manager hierarchy or install the primary site as a stand-alone site.' There are two radio button options: 'Join the primary site to an existing hierarchy' and 'Install the primary site as a stand-alone site'. The second option is selected. Below the first option, there is a text field for 'Central administration site server (FQDN):' with the example 'server1.contoso.com' and an empty input box. At the bottom right, there are three buttons: '< Previous', 'Next >', and 'Cancel'.

Primary Site Installation

Database Information, set the **Instance Name** to the one we created earlier. (MYSQLSCCM)

Microsoft Endpoint Configuration Manager Setup Wizard

Database Information

Configuration Manager primary sites require a Microsoft SQL Server database to store site settings and data.

Specify the site database server details. The instance name that you use for the site database must be configured with a static TCP port. Dynamic ports are not supported.

SQL Server name (FQDN): Example: Server1.contoso.com
SCCM.Lodini2026.us

Instance name (leave blank for default): Example: MyInstance
MYSQLSCCM

Database name: Example: CM_XYZ
CM_0000

Specify the TCP port number for SQL Server Service Broker. Configuration Manager uses Service Broker to replicate data between parent and child site database servers in the hierarchy. This port is different from the port used by the SQL Server service, which is automatically detected by Configuration Manager.

Service Broker Port: 4022

< Previous Next > Cancel

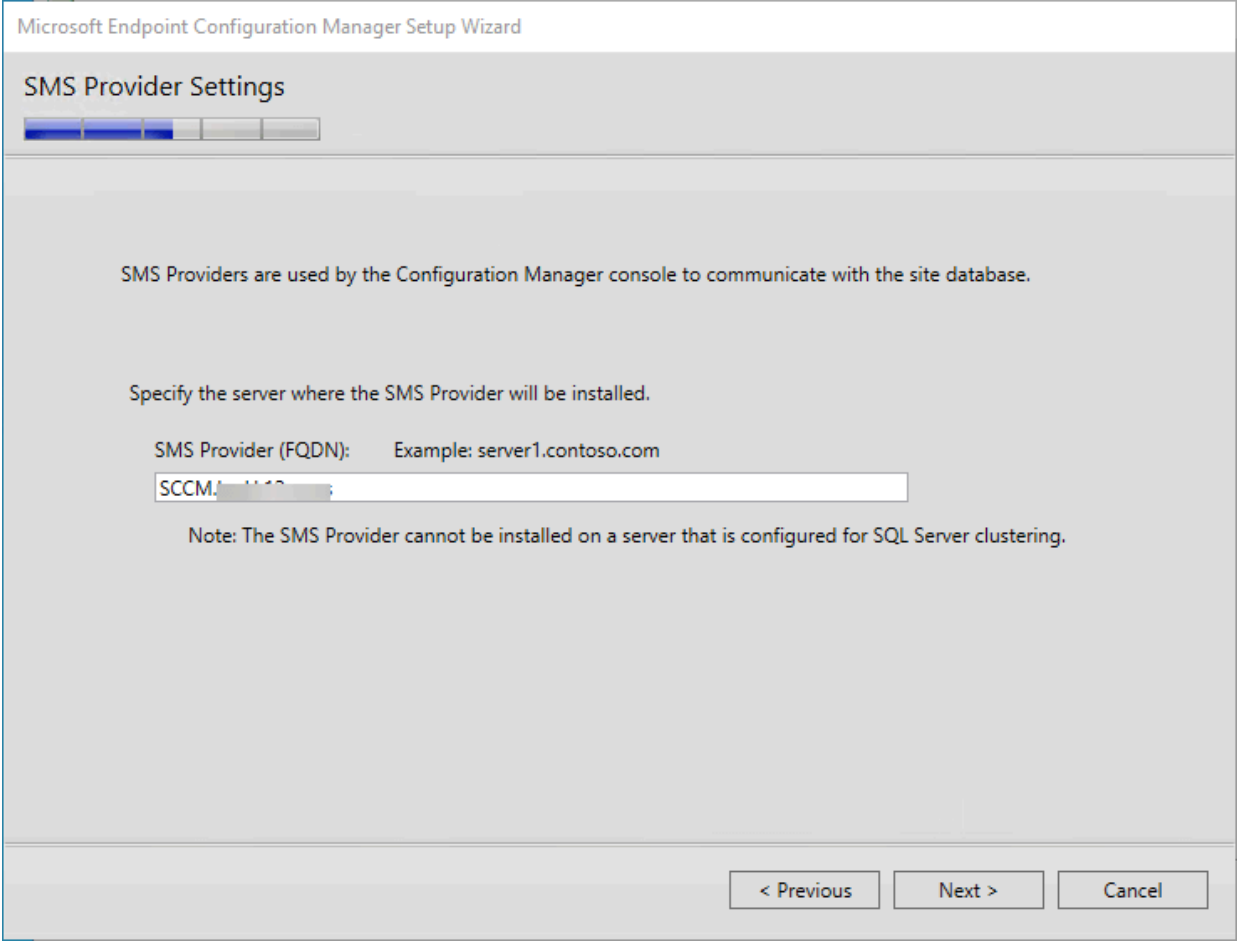

Database Information

Database Information, looks like it automatically remembered we're using our E:.

The screenshot shows the 'Database Information' step of the Microsoft Endpoint Configuration Manager Setup Wizard. The window title is 'Microsoft Endpoint Configuration Manager Setup Wizard'. Below the title bar, there is a progress indicator with five steps, the second of which is highlighted. The main heading is 'Database Information'. Below this, a instruction reads: 'Specify the locations for the SQL Server data file and transaction log file.' There are two input sections. The first is 'Path to the SQL Server data file' with a text box containing 'E:\Program Files\Microsoft SQL Server\MSSQL15.MYSQLSCCM\MSSQL\DATA\' and a 'Browse...' button. The second is 'Path to the SQL Server log file' with a text box containing 'E:\Program Files\Microsoft SQL Server\MSSQL15.MYSQLSCCM\MSSQL\DATA\' and a 'Browse...' button. At the bottom right, there are three buttons: '< Previous', 'Next >', and 'Cancel'.

Database Information

SMS Provider Settings is the FQDN of the server we'll be using. Should of auto populated for you.

The screenshot shows the 'SMS Provider Settings' window of the Microsoft Endpoint Configuration Manager Setup Wizard. The window has a title bar with the text 'Microsoft Endpoint Configuration Manager Setup Wizard'. Below the title bar is a header area with the text 'SMS Provider Settings' and a progress indicator showing four steps, with the first step being active. The main content area contains the following text: 'SMS Providers are used by the Configuration Manager console to communicate with the site database.' followed by 'Specify the server where the SMS Provider will be installed.' Below this is a label 'SMS Provider (FQDN):' followed by an example 'Example: server1.contoso.com' and a text input field containing 'SCCM.M13'. A note below the input field states: 'Note: The SMS Provider cannot be installed on a server that is configured for SQL Server clustering.' At the bottom right of the window are three buttons: '< Previous', 'Next >', and 'Cancel'.

Microsoft Endpoint Configuration Manager Setup Wizard

SMS Provider Settings

SMS Providers are used by the Configuration Manager console to communicate with the site database.

Specify the server where the SMS Provider will be installed.

SMS Provider (FQDN): Example: server1.contoso.com

SCCM.M13

Note: The SMS Provider cannot be installed on a server that is configured for SQL Server clustering.

< Previous Next > Cancel

SMS Provider Settings

Client Computer Communication Settings – We will select **Configure the communication method on each site system role**, then **Next**.

Microsoft Endpoint Configuration Manager Setup Wizard

Client Computer Communication Settings

Configuration Manager site system roles can accept HTTP or HTTPS communication from clients. Specify whether to require all site system roles to accept only HTTPS communication or allow the communication method to be configured on each site system role.

☐ All site system roles accept only HTTPS communication from clients

☒ Configure the communication method on each site system role

☐ Clients will use HTTPS when they have a valid PKI certificate and HTTPS-enabled site roles are available

Note: HTTPS communication requires client computers to have a valid PKI certificate for client authentication.

< Previous Next > Cancel

Client Computer Communication Settings

Site System Roles, make sure both boxes are checked.

Microsoft Endpoint Configuration Manager Setup Wizard

Site System Roles

Specify whether to have Setup install a management point or distribution point.

A management point provides clients with policy and content location information. It also receives configuration data from clients.

☒ Install a management point.

FQDN:

Client connection:

A distribution point contains source files for clients to download and lets you control content distribution by using bandwidth, throttling, and scheduling controls.

☒ Install a distribution point.

FQDN:

Client connection:

The site server's computer account is used to install the selected site system roles. Ensure that this account is a member of the local administrators group for the specified servers.

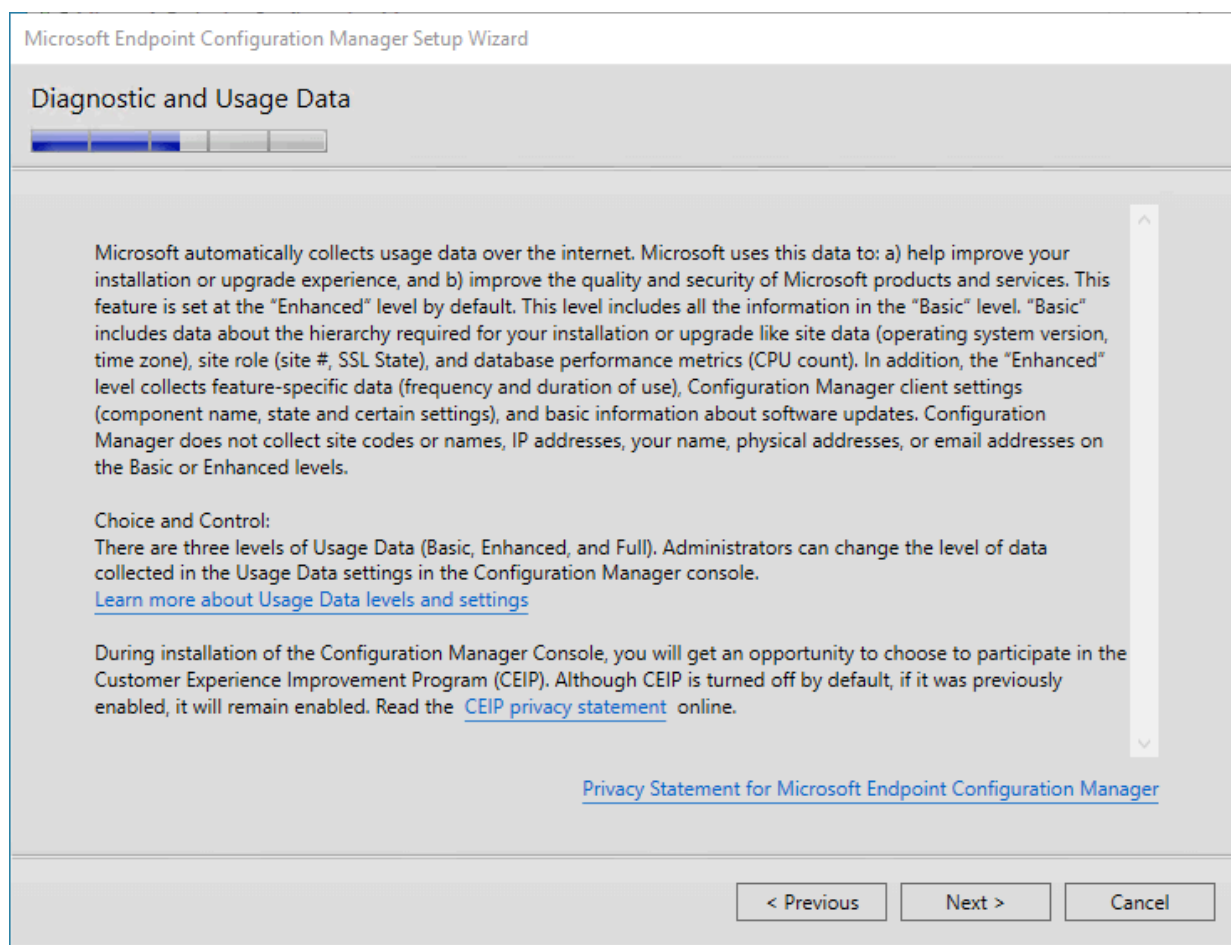

You can install additional site system roles from the Configuration Manager console after Setup finishes.

Site system roles configured to use HTTPS must have a valid PKI server certificate.

< Previous Next > Cancel

Site System Roles

Read the **Diagnostic and Usage Data** page. 😊

Diagnostic and Usage Data

Service Connection Point Setup, by default **Yes, Let's get connected (recommended)**. Next.

Microsoft Endpoint Configuration Manager Setup Wizard

Service Connection Point Setup

Keep Configuration Manager up-to-date by connecting to the Configuration Manager cloud service. Connecting to the service enables your deployment to download updates and new features.

☒ Yes, let's get connected (recommended)

Select a server to use as the service connection point (requires internet access):

SCCM.b

☐ Use a proxy server when synchronizing information from the Internet

Address: Port:

☐ Skip this for now

To connect to the service after setup completes, install a service connection point site system role.

 To use features like Conditional Access, Microsoft Store for Business or on-premises mobile device management (MDM), add your Microsoft Intune subscription to Configuration Manager after setup completes.

< Previous Next > Cancel

Service Connection Point Setup

Settings Summary, take a look and make sure everything looks correct. Then click **Next**.

Microsoft Endpoint Configuration Manager Setup Wizard

Settings Summary

Setup will install Configuration Manager with the following settings.

You have selected to install this site as a stand-alone primary site. You can expand this site into a hierarchy at a later time by installing central administration site.

Settings:

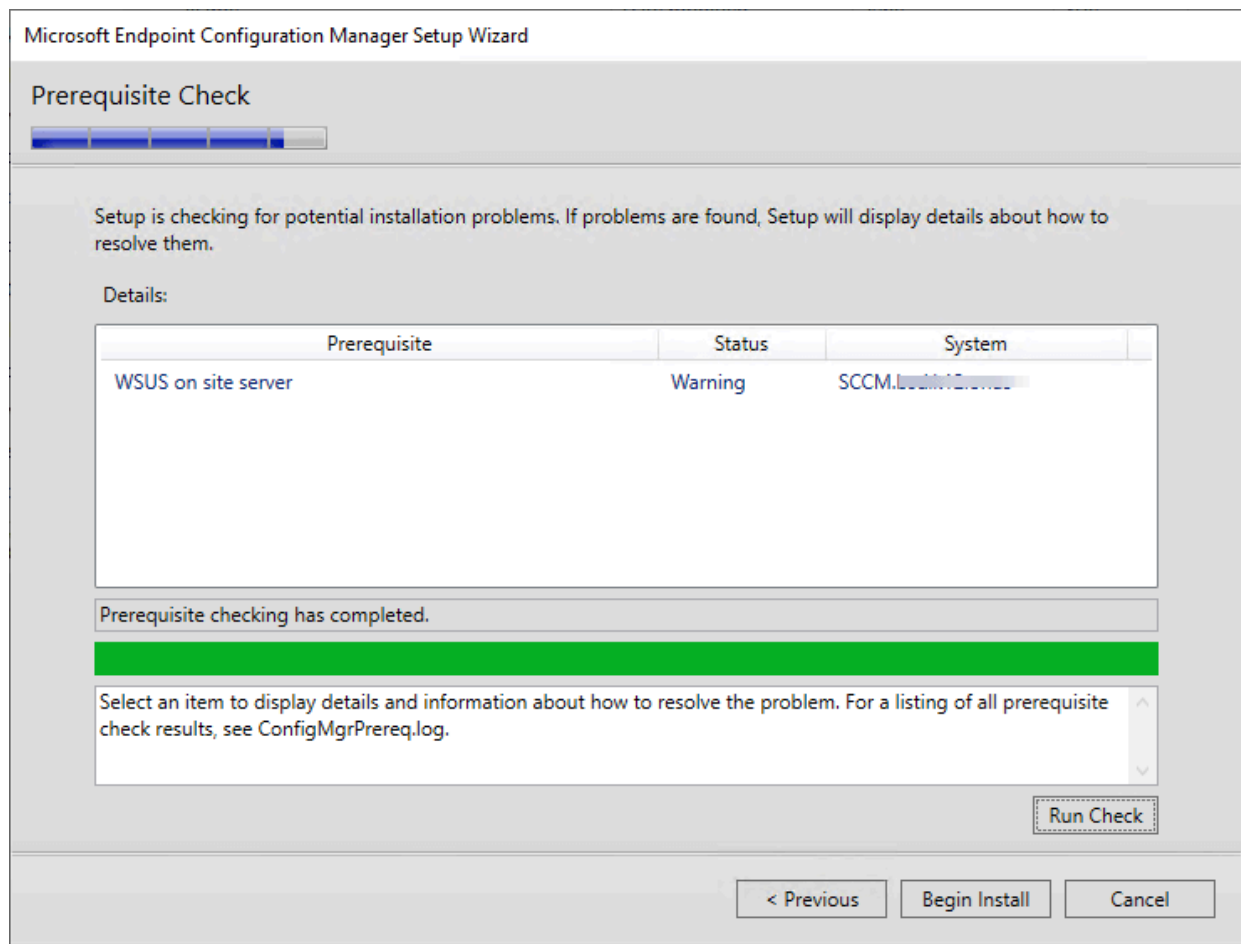

Setup Component	Component Details
Setup Type	Primary site installation
Site Code	1
Site Name	Br...
Role Communication Protocol	Client configured to communicate over both
Clients Use PKI Certificate	No
Product Key	B...
Installation Directory	D:\Program Files\Microsoft Configuration M...

To change these settings, click Previous. To apply the settings and start the installation prerequisite check, click Next.

< Previous Next > Cancel

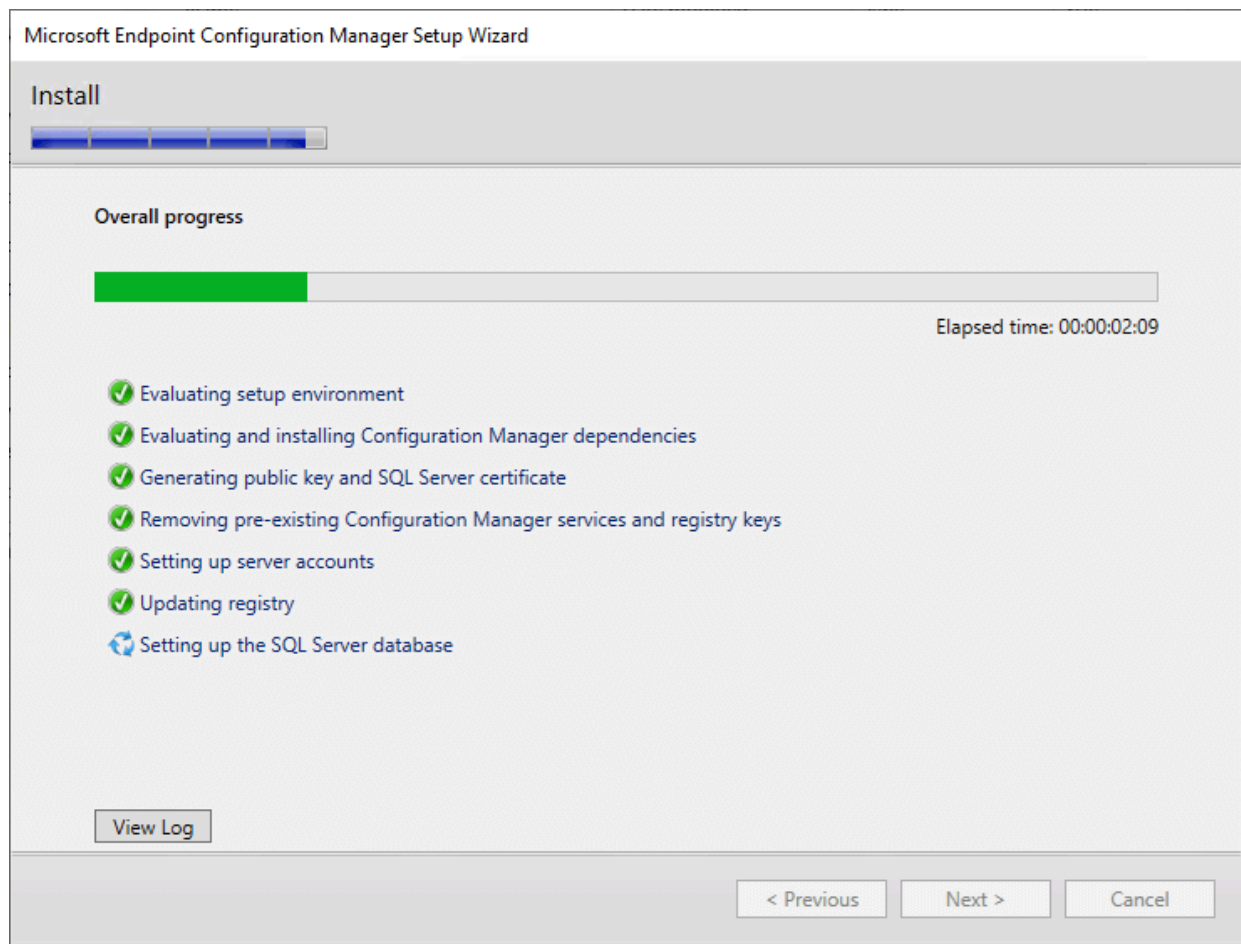

Prerequisite Check, this will take a little bit to run. Once it's complete make sure nothing has **Failed**. *If anything has you need to correct it.*

I've corrected everything except for WSUS. I'm going to ignore this as I won't be using SCCM to manage windows updates.

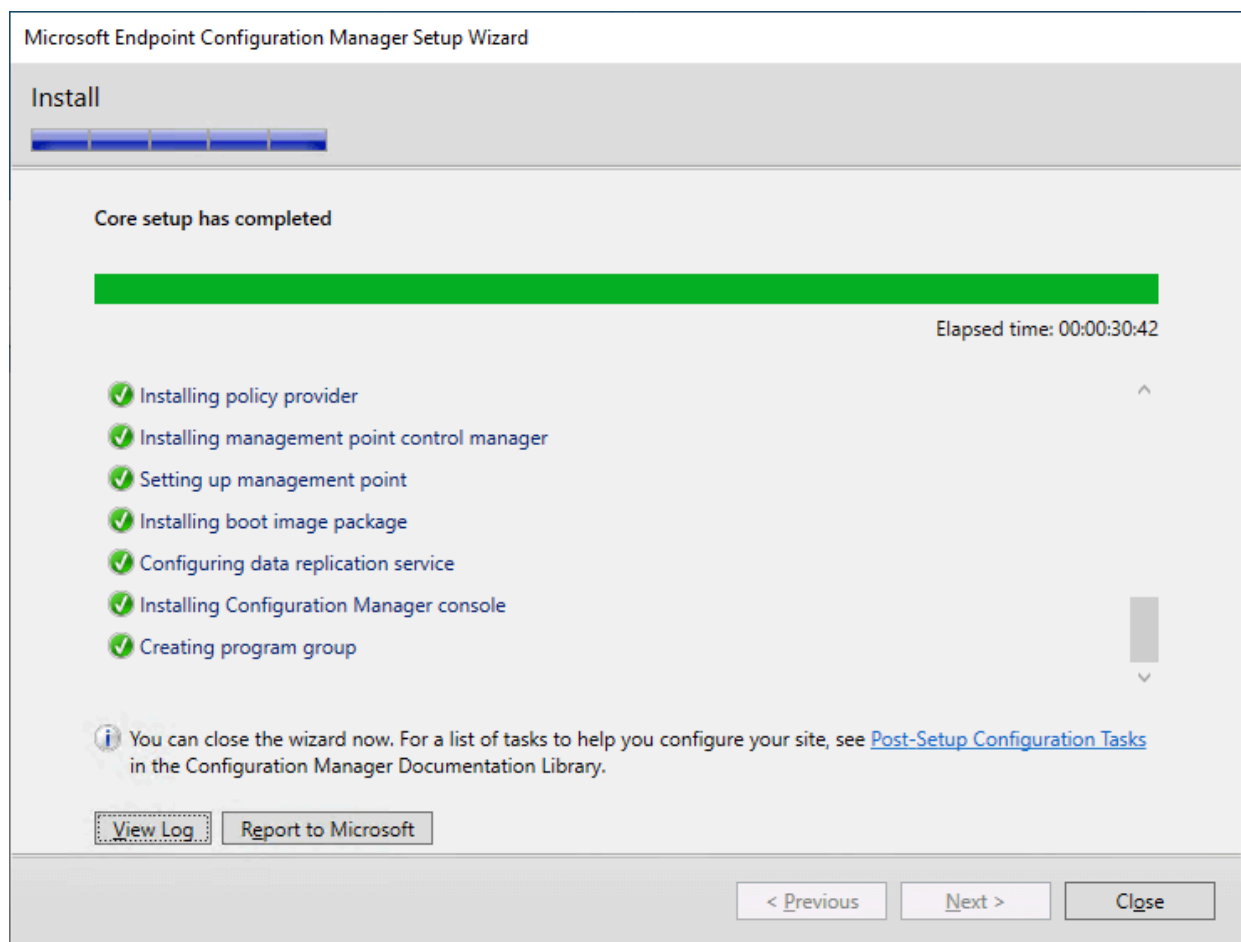

Prerequisite Check warnings

Let's click **Begin Install**.

Install progress

Install Complete!

Done!

Remember as your setting up the new instance, don't have overlapping boundaries!

Enjoy!

Tip: Don't forget to remove all the snapshots we took.

- After you're done building out your server:
- Remove previous server from ADSI System Management
- Update your PXE Boot Options in DHCP (Option 066 Boot Server Host Name) to the new IP.

About The Author

Cory Fiala

Tech enthusiast and outdoor adventurer. I'm the sole systems administrator for a K-12 school district serving over 900 staff and 5,500 students. I manage Windows Servers, Linux systems, and a vSphere environment with a 4-node cluster, 60+ virtual machines, and 8 physical servers. And that's just the day job—my personal homelab keeps the passion alive after hours.
